EVAL BOARD USER'S MANUAL

Introduction

The NB3M8T3910GEVB is a custom evaluation board developed by ON Semiconductor for the NB3M8T3910G. This evaluation board was designed to provide a flexible and convenient platform to quickly evaluate, characterize and verify the operation of the NB3M8T3910G.

This evaluation board manual contains:

- Information on the NB3M8T3910G Evaluation Board
- Assembly Instructions
- Test and Measurement Setup Procedures
- Bill of Materials

This manual should be used in conjunction with the device datasheet [NB3M8T3910/D](#) which contains full technical details on the device specifications and operation.

Bottom View

Figure 1. NB3M8T3910GEVB Top and Bottom View

READ FIRST – INTRODUCTION

The NB3M8T3910G has two banks of 5 differential outputs. Each output bank can be independently selected as LVPECL, LVDS or HCSL outputs by the SMODEAx/Bx select pins.

This evaluation board, NB3M8T3910GEVB, has been configured to evaluate each output type.

Of the ten possible differential outputs, three are dedicated as LVPECL, three are dedicated as LVDS and four are dedicated as HCSL (labeled on board).

The Single-Ended LVCMOS Output, REFOUT, is controlled by the Synchronous OE_SE pin. For Clock frequencies above 250 MHz, the REFOUT line should be disabled.

Each dedicated output pair on the board is configured per Table 1 below:

NB3M8T3910GEVB

Table 1. OUTPUT DEDICATION OF THE NB3M8T3910GEVB

Output Pin Name	Output Type (Dedicated)	SMODEA [1:0]	SMODEB [1:0]	Output Measurement Method
QA0/QA0b	LVPECL	0 0	x x	Use 50-Ω Scope Head; there is no load on the board
QA1/QA1b	LVPECL	0 0	x x	Use 50-Ω Scope Head; there is no load on the board
QA2/QA2b	LVDS	0 1	x x	Measure with Single or Differential Hi-Z Probes; Outputs have 100-Ω termination resistor across at SMA connectors
QA3/QA3b	HCSL	1 0	x x	Use 50-Ω Scope Head; there is no 50-Ω to GND on the board; or install 50-Ω SMA terminators and use a Hi-Z probe
QA4/QA4b	HCSL	1 0	x x	Use 50-Ω Scope Head; there is no 50-Ω to GND on the board; or install 50-Ω SMA terminators and use a Hi-Z probe

QB0/QB0b	LVPECL	x x	0 0	Measure with Single or Differential Hi-Z Probes; these LVPECL outputs have a Thevenin termination resistor network.
QB1/QB1b	LVDS	x x	0 1	Measure with Single or Differential Hi-Z Probes; Outputs have 100-Ω termination resistor across at SMA connectors
QB2/QB2b	LVDS	x x	0 1	Measure with Single or Differential Hi-Z Probes; Outputs have 100-Ω termination resistor across at SMA connectors
QB3/QB3b	HCSL	x x	1 0	Measure with Single or Differential Hi-Z Probes; there is 50-Ω to GND on the board
QB4/QB4b	HCSL	x x	1 0	Use 50-Ω Scope Head; there is no 50-Ω to GND on the board; or install 50-Ω SMA terminators and use a Hi-Z probe

NOTE: x = don't care

LVDS OUTPUT CONFIGURATION

Figure 2. LVDS Output Configuration

LVDS outputs are typically terminated with 100-Ω across the Q & Qb output pair.

On QA2/QA2b, QB1/QB1b, QB2/QB2b, there are on-board 100-ohm output termination resistors across the

LVDS outputs. Two 0-Ω resistors connect the metal traces and a 100-Ω resistor connects between the traces.

Use a single-ended or differential high-impedance probe across the 100-Ω resistor.

QUICK START LAB SET-UP USER'S GUIDE

“Split” or Dual Power Supply Connections

Figure 6. LVPECL – “Split” or Dual Power Supply Configuration

Most ECL outputs are open emitter and need to be DC loaded and AC terminated to $VCC - 2.0\text{ V}$ via a $50\ \Omega$ resistor. For standard ECL lab setup and test, a split (dual) power supply is recommended enabling the $50\text{-}\Omega$ internal impedance in the oscilloscope, or other measuring instrument, to be used as an ECL output load/termination. By offsetting $VCC = +2.0\text{ V}$, $SMAGND = VCC - 2.0\text{ V} = 0\text{ V}$, $SMAGND$ is the system ground, 0 V , and $DUTGND$ is -1.3 V or -0.5 V .

More information on ECL termination is provided in [AND8020/D](#).

Power Supply Connector	“Split” Power Supply
VDD/VDDOx	$VCC = +2.0\text{ V}$
SMAGND	$VTT = 0\text{ V}$
DUTGND	$DUTGND = -1.3\text{ V}$ for 3.3 V p/s or -0.5 V for 2.5 V p/s

LVC MOS OUTPUT CONFIGURATION

On REFOUT use a Hi-Z probe or the following set up to use a $50\ \Omega$ to GND sampling head Oscilloscope.

“Split” or Dual Power Supply Connections

Figure 7. LVC MOS – “Split” or Dual Power Supply Configuration

Power-Up, Input and Output Connections

1. Connect the VDD and VDDOx banana jacks with power supply cables to $+3.3\text{ V}$, and DUTGND and SMAGND to 0 V .
2. Select Crystal input and monitor 25 MHz on each Qn output.
3. Connect a signal generator to the SMA connectors for CLK0/CLK0b or CLK1/CLK1b inputs. 50-ohm termination resistors are installed for a signal generator on the board. Set appropriate input signal levels and frequency.
4. Observe the Qn outputs with a high-Z probe oscilloscope.

Table 2. POWER SUPPLY CONNECTIONS

Device Pin	Power Supply
VDD	$+3.3\text{ V}$
VDDOx	$+3.3\text{ V}$
SMAGND	0 V
DUTGND	0 V

Single Power Supply Connections

Figure 8. Single Power Supply Configuration

NB3M8T3910GEVB

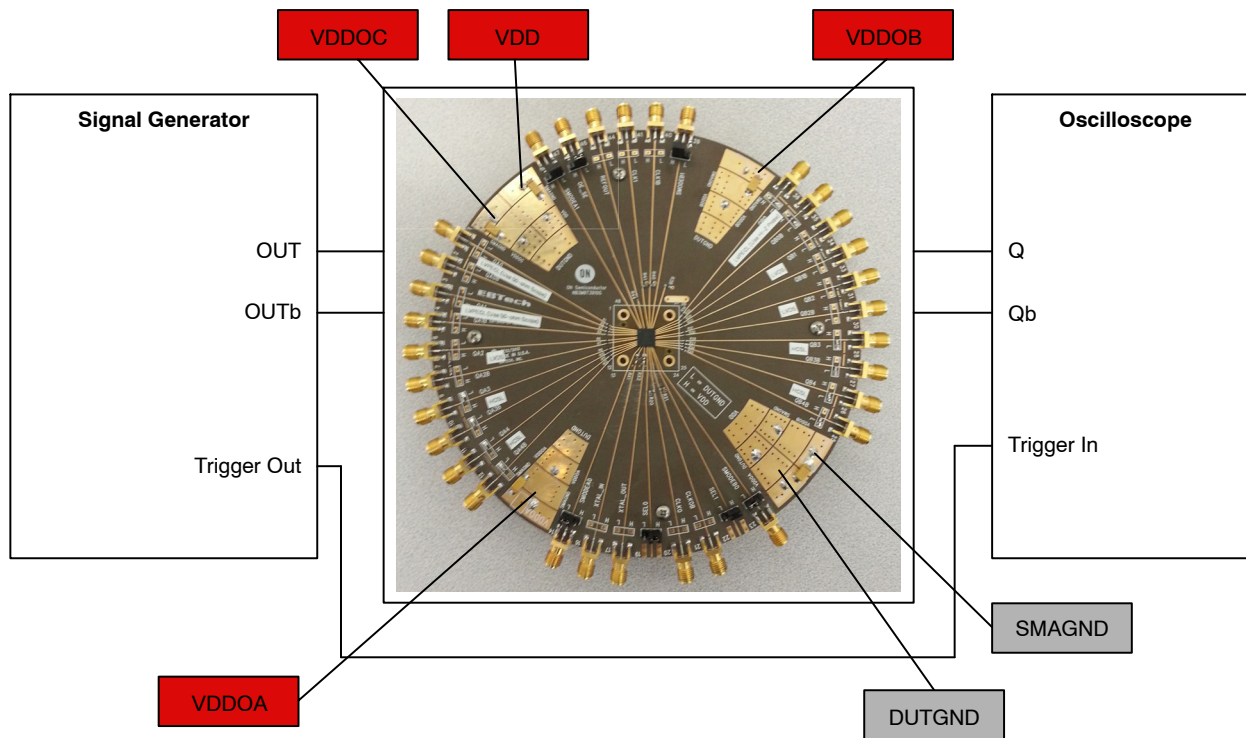

Figure 9. Typical Lab Test Set-Up

Board Layout

The custom QFN-48 Evaluation Board provides a high bandwidth, 50-Ω controlled impedance environment and is implemented in four layers. The first layer or primary “high-speed” trace layer is FR4 material, and is designed to have equal electrical length on all signal traces from the device under test (DUT) pins to the SMA connectors. The

second layer is the 0.5 oz copper ground plane and is dedicated for the SMA connector ground plane. FR4 dielectric material is placed between the second and third layers and between third and fourth layers. The third layer is also 0.5 oz copper plane. A portion of this layer is designated for the device VDD and DUTGND power planes. The fourth layer is the VDDOx layer.

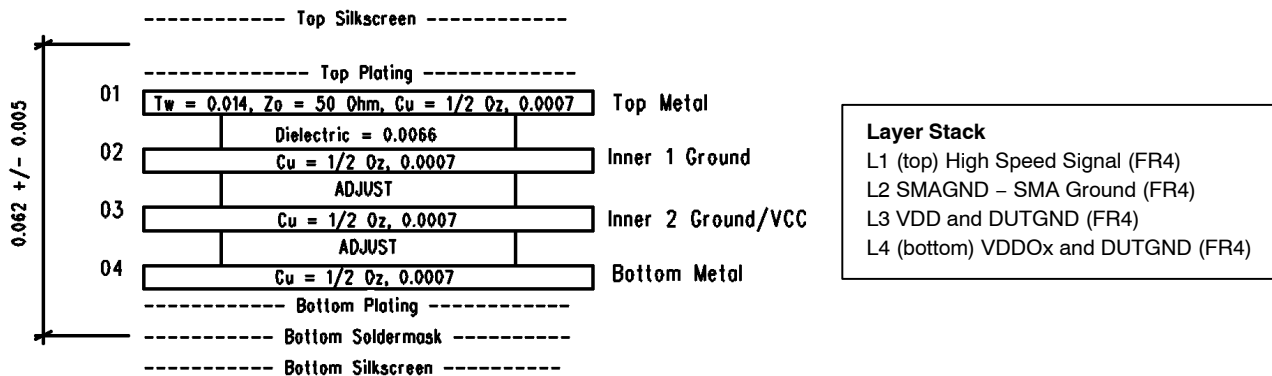

Figure 10. QFN-48 Evaluation Board Layout, 4-Layer Stack

Table 2 and Figure 8 describes the board configuration for the power supplies, Figure 3 shows typical input and output connections.

VDD is the positive power supply.

VDDOA, VDDOB, VDDOC are the positive power supplies for the outputs.

DUTGND (Device Under Test Ground) is the negative power supply for the device. Banana jack is labeled DUTGND.

Exposed Pad (EP). The exposed pad footprint on the board is mechanically connected (soldered) to the exposed pad of the QFN-48 package, and is electrically connected to DUTGND power supply.

NB3M8T3910GEVB

SMAGND is the ground for the SMA connectors, is always 0 V and is not to be confused with the device ground, DUTGND. SMAGND and DUTGND can be connected in single-supply applications.

XTAL_IN Crystal

A 25 MHz crystal is installed. Set the SELx pins in Table 3 of datasheet to select crystal. 27 pF load capacitors are installed.

If a single-ended Clock input is needed to drive XTAL_IN, then remove the crystal and load capacitor, and install a 0-ohm resistor on RX1 and a 50-ohm resistor on RT1 on bottom side. This 50-ohm to GND will terminate the signal generator. Use the XTAL_IN SMA connector.

Evaluation Board Assembly Instructions

The NB3M8T3910GEVB evaluation board was designed for characterizing devices in a 50-Ω laboratory environment using high bandwidth equipment and accommodates a custom QFN-48 socket. Table 3 contains the Bill of Materials for this evaluation board.

Solder the Device on the Evaluation Board

The soldering of a QFN-48 package to the evaluation board can be accomplished by hand soldering or solder reflow techniques using solder paste and a hot air source. Make sure pin 1 of the device is located properly and all the pins are aligned to the footprint pads. Solder the device to the evaluation board.

Installing the SMA Connectors

Each high-speed input and output has an SMA connector installed on the board. Install all the required SMA connectors onto the board and solder the center signal conductor pin to the board. Please note that the alignment of the center signal connector pin of the SMA connector to the metal trace on the board can influence lab results. The launch and reflection of the signals are largely influenced by imperfect alignment and soldering of the SMA connector.

Power Supply Configuration

Install the power supply banana jacks on the bottom side; install the appropriate bypass capacitors on top and bottom sides.

The positive power supply banana jack connector for the core and inputs is labeled VDD.

The positive power supply banana jack connector for the outputs is labeled VDDOA/B/C.

The device negative power supply banana jack connector is labeled DUTGND.

The SMA Ground plane/supply banana jack connector is labeled SMAGND.

The power supply banana jacks and typical capacitor by-pass connections of the evaluation board are shown in Figure 11.

It is recommended to add power supply bypass capacitors at the device pins to reduce unwanted noise.

10 μF capacitors are connected from VDD and VDDOx and DUTGND, to SMAGND at the banana jacks.

A 0.1 μF capacitor is installed from each VDD and VDDOx pin to SMAGND.

NOTE: Exposed Pad = DUTGND

ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.

The evaluation board/kit (research and development board/kit) (hereinafter the "board") is not a finished product and is as such not available for sale to consumers. The board is only intended for research, development, demonstration and evaluation purposes and should as such only be used in laboratory/development areas by persons with an engineering/technical training and familiar with the risks associated with handling electrical/mechanical components, systems and subsystems. This person assumes full responsibility/liability for proper and safe handling. Any other use, resale or redistribution for any other purpose is strictly prohibited.

The board is delivered "AS IS" and without warranty of any kind including, but not limited to, that the board is production-worthy, that the functions contained in the board will meet your requirements, or that the operation of the board will be uninterrupted or error free. ON Semiconductor expressly disclaims all warranties, express, implied or otherwise, including without limitation, warranties of fitness for a particular purpose and non-infringement of intellectual property rights.

ON Semiconductor reserves the right to make changes without further notice to any board.

You are responsible for determining whether the board will be suitable for your intended use or application or will achieve your intended results. Prior to using or distributing any systems that have been evaluated, designed or tested using the board, you agree to test and validate your design to confirm the functionality for your application. Any technical, applications or design information or advice, quality characterization, reliability data or other services provided by ON Semiconductor shall not constitute any representation or warranty by ON Semiconductor, and no additional obligations or liabilities shall arise from ON Semiconductor having provided such information or services.

The boards are not designed, intended, or authorized for use in life support systems, or any FDA Class 3 medical devices or medical devices with a similar or equivalent classification in a foreign jurisdiction, or any devices intended for implantation in the human body. Should you purchase or use the board for any such unintended or unauthorized application, you shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the board.

This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and may not meet the technical requirements of these or other related directives.

FCC WARNING – This evaluation board/kit is intended for use for engineering development, demonstration, or evaluation purposes only and is not considered by ON Semiconductor to be a finished end product fit for general consumer use. It may generate, use, or radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment may cause interference with radio communications, in which case the user shall be responsible, at its expense, to take whatever measures may be required to correct this interference.

ON Semiconductor does not convey any license under its patent rights nor the rights of others.

LIMITATIONS OF LIABILITY: ON Semiconductor shall not be liable for any special, consequential, incidental, indirect or punitive damages, including, but not limited to the costs of requalification, delay, loss of profits or goodwill, arising out of or in connection with the board, even if ON Semiconductor is advised of the possibility of such damages. In no event shall ON Semiconductor's aggregate liability from any obligation arising out of or in connection with the board, under any theory of liability, exceed the purchase price paid for the board, if any.
