

MAX17681A Evaluation Kit

Evaluates: MAX17681A for Isolated $\pm 15\text{V}$ or $\pm 12\text{V}$ Output Configuration

General Description

The MAX17681A evaluation kit (EV kit) is a fully assembled and tested circuit board that demonstrates the performance of the MAX17681A high-efficiency, iso-buck DC-DC converter. The EV kit operates over a wide input voltage range of 17V to 32V and uses primary-side feedback to regulate the output voltage. The EV kit has two output configurations. In the first configuration, the output is programmed to $\pm 15\text{V}$ at 100mA, with $\pm 10\%$ output voltage regulation. The second configuration uses a post regulator (MAX17651) to produce $\pm 12\text{V}$ at 50mA with less than $\pm 3\%$ regulation.

The EV kit comes installed with the MAX17681A in a 10-pin (3mm x 2mm) TDFN package and MAX17651 in a 6-pin TSOT package.

Features

- 17V to 32V Input Voltage Range
- $\pm 15\text{V}$, 100mA or $\pm 12\text{V}$, 50mA Continuous Current
- EN/UVLO Input
- 200kHz Switching Frequency
- 90% Peak Efficiency
- Overcurrent Protection
- No Optocoupler
- Delivers Up to 3W Output Power
- Overtemperature Protection
- Proven PCB layout
- Provides Robust Primary and Secondary Output Short-Circuit Protection

[Ordering Information](#) appears at end of data sheet.

Quick Start

Recommended Equipment

- One 15V to 60V DC, 0.5A power supply
- Two loads of 50mA to 100mA sink capacity
- Four digital multimeters (DMM)

Caution: Do not turn on the power supply until all connections are completed.

Procedure

The EV kit comes with default output configuration programmed to $\pm 15\text{V}$.

Test Procedure for $\pm 15\text{V}$ Output

- 1) Verify that jumper JU1 is open.
- 2) Verify that the R17–R19 are not installed.
- 3) Set the power-supply output to 24V. Disable the power supply.
- 4) Connect the positive terminal of the power supply to the VIN PCB pad and the negative terminal to the nearest PGND PCB pad. Connect the positive terminal of the first 100mA load to the +15V PCB pad and the negative terminal to the nearest GND0 PCB pad. Connect the positive terminal of the second 100mA load to the GND0 PCB pad and the negative terminal to the nearest -15V PCB pad.
- 5) Connect a DMM configured in voltmeter mode across the +15V PCB pad and the nearest GND0 PCB pad. Connect another DMM configured in voltmeter mode across the -15V PCB pad and the nearest GND0 PCB pad.
- 6) Enable the input power supply.
- 7) Enable the loads and verify that the output voltage is at $\pm 15\text{V}$ with respect to GND.
- 8) If required, vary the input voltage from 17V to 32V, the load current from 0 to 100mA, and verify that the output voltage is $\pm 15\text{V}$.

Test Procedure for $\pm 12V$ Output

- 1) Verify that JU1 is open.
- 2) Remove R16 and R10. Place 0 Ω resistors in R18 and R19. Place a 681k Ω pack-out resistor (comes with EV kit package) in R17.
- 3) Set the power-supply output to 24V. Disable the power supply.
- 4) Connect the positive terminal of the power supply to the VIN PCB pad and the negative terminal to the nearest PGND PCB pad. Connect the positive terminal of the first 50mA load to the +12V PCB pad and the negative terminal to the nearest GND0 PCB pad. Connect the positive terminal of the second 50mA load to the GND0 PCB pad and the negative terminal to the nearest -12V PCB pad.
- 5) Connect a DMM configured in voltmeter mode across the +12V PCB pad and the nearest GND0 PCB pad. Connect another DMM configured in voltmeter mode across the -12V PCB pad and the nearest GND0 PCB pad.
- 6) Enable the input power supply.
- 7) Enable the loads and verify that the output voltage is at $\pm 12V$ with respect to GND.
- 8) If required, vary the input voltage from 17V to 32V, the load current from 0 to 50mA, and verify that the output voltage is $\pm 12V$.

Detailed Description

The EV kit is a fully assembled and tested circuit board that demonstrates the performance of the MAX17681A high-efficiency, iso-buck DC-DC converter designed to provide isolated power up to 3W. The EV kit generates either $\pm 15V$, 100mA or $\pm 12V$, 50mA output voltages from a 17V to 32V input supply. The EV kit features a forced-PWM control scheme that provides constant switching-frequency of 200kHz operation at all load and line conditions.

The EV kit includes an EN/UVLO PCB pad to enable control of the converter output. The VPRI PCB pad helps measure the regulated nonisolated buck voltage. An additional RESET PCB pad is available for monitoring FB regulated voltage, the open-drain logic output. The programmable soft-start feature allows users to reduce input inrush current.

The iso-buck is a synchronous-buck-converter-based topology, useful for generating isolated outputs at low power level without using an optocoupler. The detailed procedure for setting the soft-start time, ENABLE/UVLO divider, primary output-voltage (V_{PRI}) selection, adjusting the primary output voltage, primary inductance selection, turns-ratio selection, output capacitor selection, output diode selection, and external loop compensation are given in the MAX17681 IC data sheet. The post-regulator MAX17651 output-voltage setting and additional related information are detailed in the MAX17651 IC data sheet.

Enable Control (JU1)

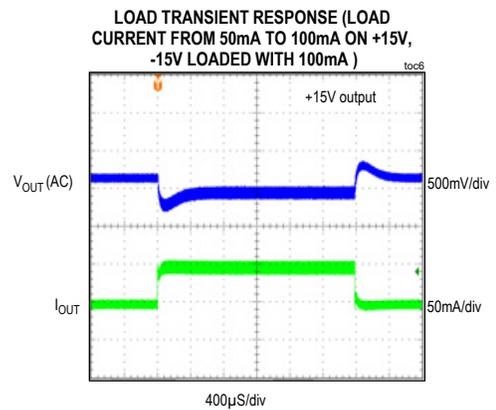

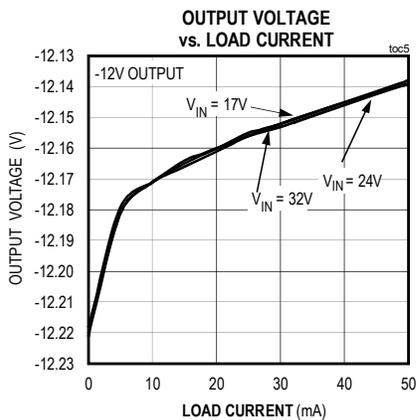

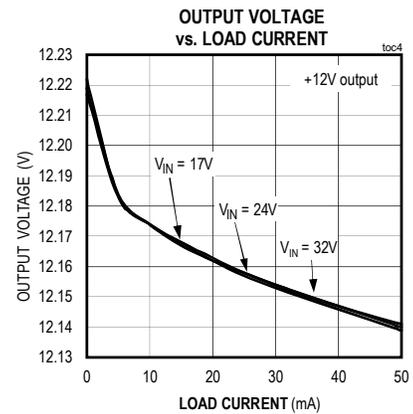

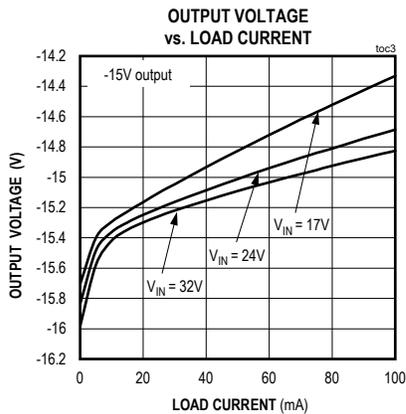

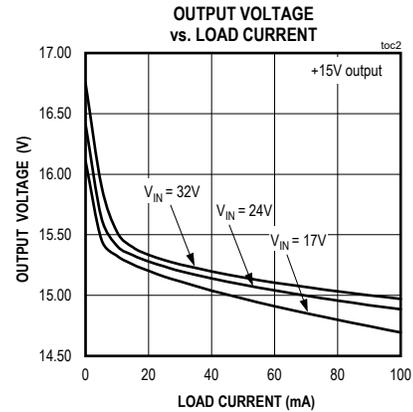

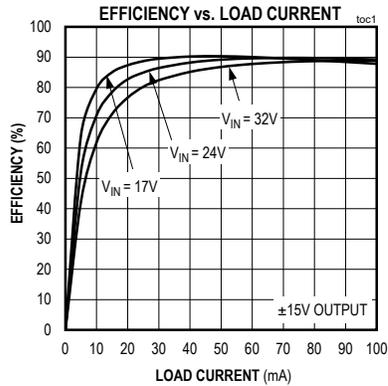

The EN/UVLO pin on the device serves as an on/off control while also allowing the user to program the input undervoltage-lockout (UVLO) threshold. JU1 configures the EV kit's output for on/off control. Install a shunt across JU1 pins 2-3 to disable VOUT. See [Table 1](#) for proper JU1 jumper configurations.

Table 1. Enable Control (EN/UVLO) (JU1) Jumper Settings

| SHUNT POSITION | EN/UVLO PIN | VOUT OUTPUT |
|----------------|--|-----------------------------|
| 1-2 | Connected to VIN | Enabled |
| 2-3 | Connected to GND | Disabled |
| Open* | Connected to midpoint of R1, R2 resistor-divider | Enabled at VIN \geq 15.5V |

*Default position.
