# 500 mA High Accuracy Low Dropout Linear Regulator, with Power Good Function

The NCV8537 is a high performance low dropout linear voltage regulator. Based on the popular NCV8535, the device retains all the best features of its predecessor which includes high accuracy, excellent stability, low noise performance and reverse bias protection but now includes a Power Good output signal to enable monitoring of the supply system. The device is available with fixed or adjustable outputs and is packaged in a 10 pin 3x3 mm DFN package.

## Features

- High Accuracy Output Over Line and Load Variances (±0.9% at 25°C)
- Operating Temperature Range: -40°C to 125°C
- Power Good Output to Indicate the Regulator is Within Specified Limits
- Stable Output with Low Value Capacitors of any type and with no Minimum Load Current Requirement
- Incorporates Current Limiting and Reverse Bias Protection
- Thermal Shutdown Protection
- Low Dropout Voltage at Full Load (340 mV typ at  $V_0 = 3.3 \text{ V}$ )
- Low Noise (33  $\mu$ Vrms w/ 10 nF C<sub>nr</sub> and 52  $\mu$ Vrms w/out C<sub>nr</sub>)
- Low Shutdown Current (< 1 mA)
- Reverse Bias Protected
- 2.9 V to 12 V Supply Range
- Available in 1.8 V, 2.5 V, 3.3 V, 5.0 V and Adjustable Output Voltages
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These are Pb–Free Devices

## Applications

- Networking Systems, DSL/Cable Modems
- Audio Systems for Automotive Applications
- Navigation Systems
- Satellite Receivers

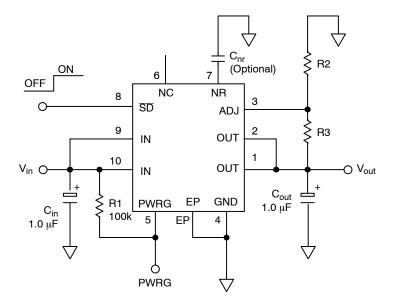

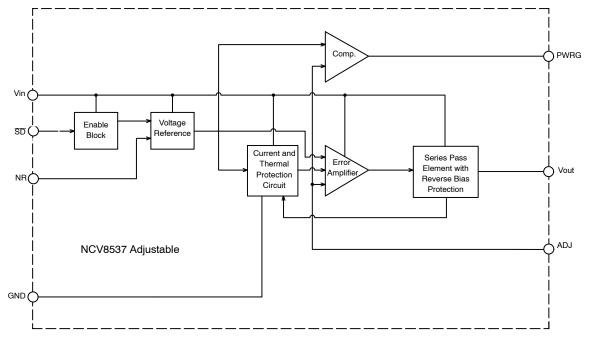

Figure 2. Typical Adjustable Version Application Schematic

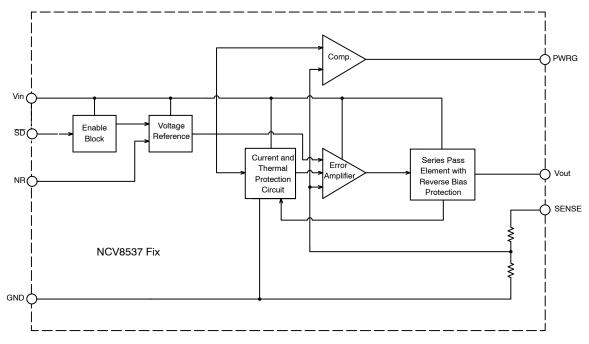

Figure 4. Block Diagram, Fixed Output Version

## **PIN FUNCTION DESCRIPTION**

Pin No.	Pin Name	Description
1, 2	V <sub>out</sub>	Regulated output voltage. Bypass to ground with $C_{out} \geq 1.0 \ \mu F$
3	SENSE/ADJ	For output voltage sensing, connect to Pins 1 and 2.at Fixed output Voltage version Adjustable pin at Adjustable output version
4	GND	Power Supply Ground
5	PWRG	Power Good
6	NC	Not Connected
7	NR	Noise Reduction Pin. This is an optional pin used to further reduce noise.
8	SD	Shutdown pin. When not in use, this pin should be connected to the input pin.
9, 10	V <sub>in</sub>	Power Supply Input Voltage
EPAD	EPAD	Exposed thermal pad should be connected to ground.

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage	V <sub>in</sub>	-0.3 to +16	V
Output Voltage	V <sub>out</sub>	–0.3 to V <sub>in</sub> +0.3 or 10 V*	V
PWRG Pin Voltage	V <sub>PWRG</sub>	–0.3 to +16	V
Shutdown Pin Voltage	V <sub>sh</sub>	–0.3 to +16	V
Junction Temperature Range	Т <sub>Ј</sub>	-40 to +150	°C
Storage Temperature Range	T <sub>stg</sub>	–50 to +150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

NOTE: This device series contains ESD protection and exceeds the following tests:

Human Body Model (HBM) tested per AEC-Q100-002 (EIA/JESD22-A114)

Machine Model (MM) tested per AEC-Q100-003 (EIA/JESD22-A115)

Charged Device Model (CDM) tested per EIA/JESD22-C101.

\*Which ever is less. Reverse bias protection feature valid only if  $(V_{out} - V_{in}) \le 7 V$ .

## THERMAL CHARACTERISTICS

	Test Conditions (Typical Value)				
Characteristic	Min Pad Board (Note 1)	1" Pad Board (Note 1)	Unit		
Junction-to-Air, θJA	215	66	°C/W		
Junction-to-Pin, J-L4	58	18	°C/W		

1. As mounted on a 35 x 35 x 1.5 mm FR4 Substrate, with a single layer of a specified copper area of 2 oz (0.07 mm thick) copper traces and heat spreading area. JEDEC 51 specifications for a low and high conductivity test board recommend a 2 oz copper thickness. Test conditions are under natural convection or zero air flow.

## **ELECTRICAL CHARACTERISTICS - 1.8 V**

(V<sub>out</sub> = 1.8 V typical, V<sub>in</sub> = 2.9 V,  $T_A = -40^{\circ}C$  to +125°C, unless otherwise noted, Note 2)

Characteristic	Symbol	Min	Тур	Max	Unit
Output Voltage (Accuracy) $V_{in}$ = 2.9 V to 5.8 V, I <sub>load</sub> = 0.1 mA to 500 mA, T <sub>A</sub> = 25°C	V <sub>out</sub>	-0.9% 1.783	1.8	+0.9% 1.817	V
Output Voltage (Accuracy) $V_{in}$ = 2.9 V to 5.8 V, I <sub>load</sub> = 0.1 mA to 500 mA, T <sub>A</sub> = 0°C to +85°C	V <sub>out</sub>	–1.4% 1.774	1.8	+1.4% 1.826	V
Output Voltage (Accuracy) $V_{in}$ = 2.9 V to 5.8 V, I <sub>load</sub> = 0.1 mA to 500 mA, T <sub>A</sub> = -40°C to +125°C	V <sub>out</sub>	-1.5% 1.773	1.8	+1.5% 1.827	V
Minimum Input Voltage	V <sub>inmin</sub>		2.9		V
Line Regulation $V_{in} = 2.9 \text{ V to } 12 \text{ V}, \text{ I}_{load} = 0.1 \text{ mA}$	Line <sub>Reg</sub>		0.04		mV/V
Load Regulation V <sub>in</sub> = 2.9 V, I <sub>load</sub> = 0.1 mA to 500 mA	Load <sub>Reg</sub>		0.04		mV/mA
Dropout Voltage (See Figure 9) I <sub>load</sub> = 500 mA (Notes 3, 4) I <sub>load</sub> = 300 mA (Notes 3, 4) I <sub>load</sub> = 50 mA (Notes 3, 4)	V <sub>DO</sub>		620 230 95		mV
Peak Output Current (See Figures 14 and 17)	I <sub>pk</sub>	500	700	830	mA
Short Output Current (See Figure 14) $V_{in}$ < 7 V, $T_A$ = 25°C	I <sub>sc</sub>			900	mA
Thermal Shutdown / Hysteresis	TJ		160/10		°C
Ground Current In Regulation $I_{load} = 500 \text{ mA} \text{ (Note 3)}$ $I_{load} = 300 \text{ mA} \text{ (Note 3)}$ $I_{load} = 50 \text{ mA}$ $I_{load} = 0.1 \text{ mA}$	IGND		9.0 4.6 0.8 -	14 7.5 2.5 220	mA μA
In Dropout V <sub>in</sub> = 2.2 V, I <sub>load</sub> = 0.1 mA				500	μA
In Shutdown V <sub>SD</sub> = 0 V	I <sub>GNDsh</sub>			1.0	μΑ
Output Noise $C_{nr} = 0 \text{ nF}$ , $I_{load} = 500 \text{ mA}$ , f = 10 Hz to 100 kHz, $C_{out} = 10 \mu\text{F}$ $C_{nr} = 10 \text{ nF}$ , $I_{load} = 500 \text{ mA}$ , f = 10 Hz to 100 kHz, $C_{out} = 10 \mu\text{F}$	V <sub>noise</sub>		52 33		μVrms μVrms
Power Good Voltage Low Threshold Hysteresis High Threshold	V <sub>elft</sub>	93	95 2 97	99	% of V <sub>out</sub>
Power Good Pin Voltage Saturation (I <sub>ef</sub> – 1.0 mA)	V <sub>efdo</sub>		200		mV
Power Good Pin Leakage	I <sub>efleak</sub>		1.0		μΑ
Power Good Blanking Time (Note 7)	t <sub>ef</sub>		50		μs
Shutdown Threshold Voltage ON Threshold Voltage OFF	V <sub>SD</sub>	2.0		0.4	V V
SD Input Current, $V_{SD}$ = 0 V to 0.4 V or $V_{SD}$ = 2.0 V to $V_{in}$	I <sub>SD</sub>		0.07	1.0	μΑ
Output Current In Shutdown Mode, V <sub>out</sub> = 0 V	I <sub>OSD</sub>		0.07	1.0	μΑ
Reverse Bias Protection, Current Flowing from the Output Pin to GND (V <sub>in</sub> = 0 V, V <sub>out forced</sub> = 1.8 V)	I <sub>OUTR</sub>		10		μΑ

Performance guaranteed over the operating temperature range by design and/or characterization, production tested at T<sub>J</sub> = T<sub>A</sub> = 25°C. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
T<sub>A</sub> must be greater than 0°C.
Maximum dropout voltage is limited by minimum input voltage V<sub>in</sub> = 2.9 V recommended for guaranteed operation.

### **ELECTRICAL CHARACTERISTICS - 2.5 V**

(V<sub>out</sub> = 2.5 V typical, V<sub>in</sub> = 2.9 V,  $T_A = -40^{\circ}C$  to +125°C, unless otherwise noted, Note 5)

Characteristic	Symbol	Min	Тур	Max	Unit
Output Voltage (Accuracy) $V_{in}$ = 2.9 V to 6.5 V, I <sub>load</sub> = 0.1 mA to 500 mA, T <sub>A</sub> = 25°C	V <sub>out</sub>	-0.9% 2.477	2.5	+0.9% 2.523	V
Output Voltage (Accuracy) $V_{in}$ = 2.9 V to 6.5 V, I <sub>load</sub> = 0.1 mA to 500 mA, T <sub>A</sub> = 0°C to +85°C	V <sub>out</sub>	-1.4% 2.465	2.5	+1.4% 2.535	V
Output Voltage (Accuracy) $V_{in}$ = 2.9 V to 6.5 V, I <sub>load</sub> = 0.1 mA to 500 mA, T <sub>A</sub> = -40°C to +125°C	V <sub>out</sub>	-1.5% 2.462	2.5	+1.5% 2.538	V
Minimum Input Voltage	V <sub>inmin</sub>		2.9		V

NOTE: Typical characteristics were measured with the same conditions as electrical characteristics.

## APPLICATIONS INFORMATION

## **Reverse Bias Protection**

Reverse bias is a condition caused when the input voltage goes to zero, but the output voltage is kept high either by a large output capacitor or another source in the application which feeds the output pin.

Normally in a bipolar LDO all the current will flow from the output pin to input pin through the PN junction with limited current capability and with the potential to destroy the IC.

Due to an improved architecture, the NCV8537 can withstand up to 7.0 V on the output pin with virtually no current flowing from output pin to input pin, and only negligible amount of current (tens of  $\mu$ A) flowing from the output pin to ground for infinite duration.

#### **Input Capacitor**

An input capacitor of at least 1.0  $\mu$ F, any type, is recommended to improve the transient response of the regulator and/or if the regulator is located more than a few inches from the power source. It will also reduce the circuit's sensitivity to the input line impedance at high frequencies. The capacitor should be mounted with the shortest possible track length directly across the regular's input terminals.

#### **Output Capacitor**

The NCV8537 remains stable with any type of capacitor as long as it fulfills its 1.0  $\mu$ F requirement. There are no constraints on the minimum ESR and it will remain stable up to an ESR of 5.0  $\Omega$ . Larger capacitor values will improve the noise rejection and load transient response.

#### **Noise Reduction Pin**

Output noise can be greatly reduced by connecting a 10 nF capacitor ( $C_{nr}$ ) between the noise reduction pin and ground (see Figure 1). In applications where very low noise is not required, the noise reduction pin can be left unconnected.

#### **Dropout Voltage**

The voltage dropout is measured at 97% of the nominal output voltage.

#### **Thermal Considerations**

Internal thermal limiting circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. This feature provides protection from a catastrophic device failure due to accidental overheating. This protection feature is not intended to be used as a substitute to heat sinking. The maximum power that can be dissipated, can be calculated with the equation below:

$$P_{D} = \frac{T_{J}(max) - T_{A}}{R_{\theta}JA} \qquad (eq. 1)$$

For improved thermal performance, contact the factory for the DFN package option. The DFN package includes an exposed metal pad that is specifically designed to reduce the junction to air thermal resistance,  $R_{\rm BJA}$ .

#### **Adjustable Operation**

The output voltage can be set by using a resistor divider as shown in Figure 2 with a range of 1.25 to 10 V. The appropriate resistor divider can be found by solving the equation below. The recommended current through the resistor divider is from 10  $\mu$ A to 100  $\mu$ A. This can be accomplished by selecting resistors in the k $\Omega$  range. As result, the I<sub>adj</sub> \* R2 becomes negligible in the equation and can be ignored.

$$V_{out} = 1.25 * (1 + R3/R2) + I_{adi} * R2$$
 (eq. 2)

## **Power Good Operation**

The Power Good pin on the NCV8537 will produce a logic Low when it drops below the nominal output voltage. Refer to the electrical characteristics for the threshold values at which point the Power Good goes Low. When the NCV8537 is above the nominal output voltage, the Power Good will remain at logic High.

The external pullup resistor needs to be connected between  $V_{in}$  and the Power Good pin. A resistor of approximately 100 k $\Omega$  is recommended to minimize the current consumption. No pullup resistor is required if the Power Good output is not being used. The Power Good does not function during thermal shutdown and when the part is disabled.
