

TTM-210

DIGITAL CONTROLLER

TTM-214

TTM-215

TTM-217

TOHO ELECTRONICS INC.

DIGITAL TTM-210

Features

•Controllability is improved with the New PID Algorithm

①The time it takes from the control start until it is stabilized has been shortened.

 (2) The jump-less control function which controls the occurrence of overshoot after the disturbance has been incorporated.
 (3) 3-kinds of PID control is selectable.

•Full multiple input

With just one unit, it can accommodate different types of input such as thermocouples (13 types), platinum resistance temperature sensor (2 types), voltage (5 types), current (1 type).

Sampling cycle

Speed-up to 200mS has been realized.

A liquid crystal display has been incorporated for the display
 The indication range has been extended to 5-digit display.
 Realization of various indications with 11 segment display.

③LED is used for the back-light.

PV indication auto-change

The Process value (PV) display condition can be set at Lighting, Flashing (high speed), Flashing (low speed), relative to the set value (SV).

Compact size

The TTM-210 series is made compact with depth of 59.7 mm (for TTM-214), 65 mm (for TTM-215, 217, 219). Moreover, the protrusive portion for the panel side attachment is only 2 mm. (TTM-214: 2.5mm)

Loader communication function

This function is most appropriate for the set-up work of the parameters. Cable: optional (sold separately) Software: optional (provided free-of-charge downloadable from our

Software: optional (provided free-of-charge downloadable from our website)

Extensive output type

Relay contact, SSR drive, open collector, voltage (5 types) and current.

Enhanced optional function

①CT input (max. of 2-points), ②Event input (max. of 4-points), ③Event output (max. of 7-points, however, when all 7-points are used, the control output will not be available for use)

• External standards (TTM-214 only) Conforms to CE markings

UL, c-UL, UKCA markings have been acquired. %TTM-215/217/219 Pending application

Protection structure (TTM-214 only) Corresponds to "IP66".

Valve position proportionality control

A function has been incorporated enabling the unit to carry out valve position proportionality control without the feedback resistance.

Front Panel

Blind function

The system can be configured so that only the specific parameters are displayed from the set of parameters.

- Simplified programmable controlling function A max. of 8-step program control is possible.
- Simple timer function (3-point stand-alone)

A control of "Control start or stop after a lapse of certain time" is possible with a single unit. An independent use as a timer (event output ON/OFF) is possible.

Priority screen

Indication/Setting is possible without shifting to parameter screen by indicating the necessary parameter screen with operation mode screen. (max. 16 screens)

Digital PV filter

A filter can be applied with software in response to sudden changes of input value.

Manual control

Manual output function will enable the application of various instrumentation systems.

•Communication function (RS485: Dedicated protocol / MODBUS) A communication distance can be extended to a maximum of 500 meters, and up to 31 units can be connected simultaneously. With one host computer, a centralized monitoring such as "collection

With one host computer, a centralized monitoring such as "collection of all data", "changes of various setting value" is possible from a distant location.

Soft-start function

During the PID control mode, in the READY \rightarrow RUN mode (or when the power is turned ON), a limit can be applied for a certain period of time to the operation volume.

Delay timer (available during ON/OFF control only)

During ON/OFF control, the minimum duration time can be set independently for ON & OFF regardless of the control. This function is useful for any equipment which is not suited for frequent ON/OFF switching, or may be used as protection for the freezing equipment.

Loop error

This function monitors the measured value and operation volume, and detects the abnormality in the control loop.

Bank automatic switching function

This is a function which switches the bank automatically according to the input value (PV, SV). It optimizes the control parameters.

Operation flow

Standard specifications

Input type	Thermocouple	K, J, T, E, R, S, B N 111	L, WRe5-26, PR40-20, PI	II (input resistance 1M	Ω)

Terminal explanation

•				
Communication	Please connect A & B terminals correctly. (Please use a converter when it is not RS-485)			
Output	Relay contact point	C: Common, No: Normal open		
	SSR drive	Please connect directly to INPUT + $\&$ – at SSR side.		
	Transmission, Open collector			
CT input	Please connect a specified current transformer directly. (CTL-6-P-H)			
PV input/ Al input	Thermocouple Current/ voltage	Take note of polarities + & — when making connections.		
	RTD	Take note of the terminals A, B & b when making connections.		
DI	COM: Common (The polarity can be switched)			
Al input	Take note of polarities + & – when making connections.			
Power	In case of 24VD 1: (+), terminal	C, the polarity assignment shall be terminal no. no. $\textcircled{2}: (-)$

Panel Installation

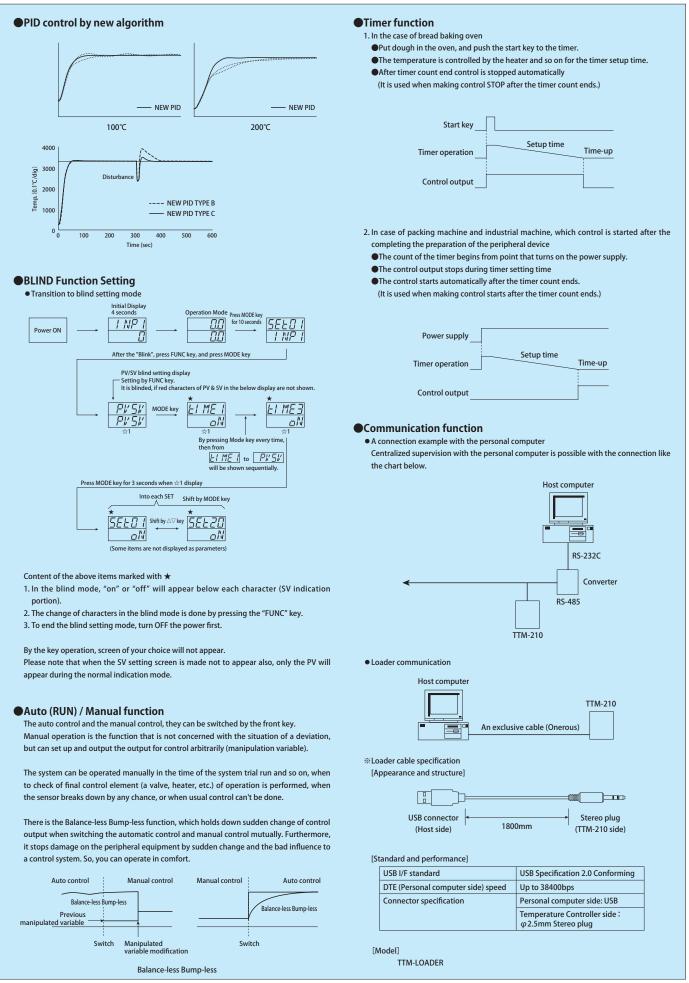

* How to remove the attachment

Insert the tip of the flat head screwdriver between the controller body and the clip of the attachment, then rotate the screwdriver to suspend the clip, and remove the attachment.

Advanced Features

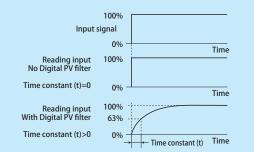

• Digital PV filter

It is the function to realize the CR filter effect on the software by performing primary delay operation to the measured value (PV).

The effect of the filter can be set by the time constant.

(Time constant is the time that the PV value reaches up to about 63% when the input changes on the step.)

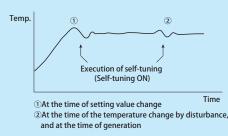

The use of Digital PV filter

 Removal of high frequency noise --- The influence of a noise when an electric noise joining an input is mitigated.

2) A response can be delayed against the sudden change of the input.

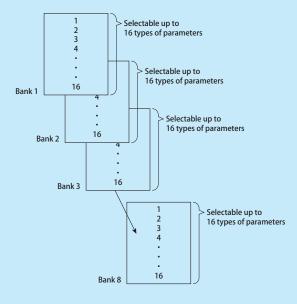

Self-tuning PID

Bank function

TTM-210 series has a bank function which stores up to 16 types of selected parameters in each of 8 banks.

Different temperature control with one unit can be realized with the presetting of the corresponding parameters in each bank and by simply switching the bank through key operation, DI, or communication without changing the temperature setting and the PID values each time.

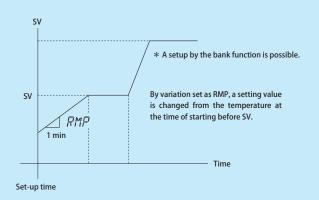

Ramp function

It is a function to give PV value an inclination against the changes of SV value. In the actual action, the "dummy" set value is made to change gradually, and the control is done against the "dummy" set value.

The variation per minute of SV is set.

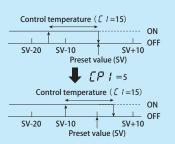

The effect of the ramp function is best exercised when sudden changes of control result is not acceptable due to the characteristics of physical object to be controlled, or, when the changing process (inclination) of the control result of the physical object becomes important.

Please note that this function changes only the SV, therefore, if great effect is expected on the PV, the expected result may not be obtained.

OFF point position movement of ON/OFF control

When the OFF point position movement is set to 0, the OFF point is the set value position.

Above is when the OFF point position shift is set at (+5). The actual set value does not vary with above figures, but the position, as ON/OFF, moves (+5) towards the upper side. When the position is moved towards the minus side, the OFF point will move in reverse direction to the positions indicated above.

Bank auto-switching function

• It is a function in which the bank automatically switches by PV / SV. By setting the desired value to each bank, an optimized parameter can be created in each temperature range.

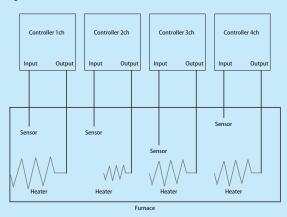

Example) PID values during the PID control can be set differently in each bank.

S	v

Simultaneous temperature rise function

Simultaneous temperature rise

- When simultaneous temperature rise control is exerted by multi-channels using the RS-485 communication function, a master and slave are determined beforehand. This permits reaching the respective goal values at the same time regardless of the characteristic of each channel.
- The channel, in which the time from the start of control to the reach to the goal value is the longest, is specified as a master. The other channels are specified as slaves.
- The simultaneous temperature rise function is started at the start of run (including the power ON time) or a change of setting value, and is ended when the master reaches the goal value.

• How to use

- 1. Perform communication protocol settings to the TOHO protocol.
- In the communication changeover setting, set the channel, in which the temperature reaches the goal value latest, to the simultaneous temperature rise master, and then set the other channels to the simultaneous temperature rise slaves.
- 3. Set the main control sensitivity.

During a simultaneous temperature rise, the slave side exerts ON/OFF control for the current temperature of the master. Accordingly, set the sensitivity to a level that does not cause chattering.

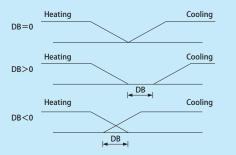

Note: Precautions on use

- 1. Perform auto tuning for each channel as required.
- 2. When using the simultaneous temperature rise function, do not perform communication with the outside.

Heating / Cooling

By allotting main output and secondary output to 2 output points respectively, heating and cooling control would be possible.

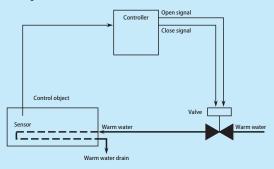

With the DB (Dead Band) setting, a range can be set between the heating output and the cooling output.

Position proportional control

Position proportional control

- According to the operation amount required for PID control, the valve opening is changed by outputting an open signal or close signal to the valve on the basis of the valve motor stroke time, so that the flow rate is adjusted, thereby controlling the target temperature. The control can be exerted without feedback resistance.
- The valve motor stroke time means the time from the full opening of the valve till its full closing.

· Valve motor drive dead band

In position proportional control, the open signal or close signal is output so that the operation amount of the regulator may agree with the opening of the valve.

It is necessary to refrain from performing an open/close changeover operation frequently in consideration of the service life of the valve.

A dead band is provided at the open signal/close signal output changeover point.

In this area, both open signal output and close signal output are stopped to reduce frequent open/close changeover operations.

Initial opening after the end of AT

It is possible to set the operation amount just after the end of auto tuning in order to restrict undershoot just after this end.

Remote SV

Signals from external sources become the controller parameters.

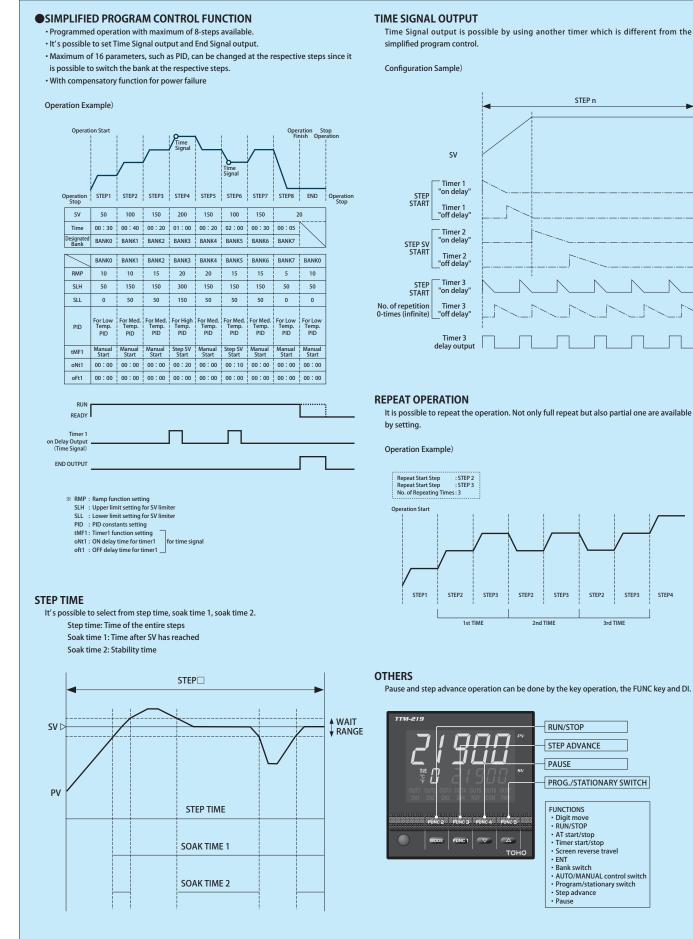

Cascade control using remote SV

Cascade control is where the control signal for a single controller is applied to other controllers, and the controller that receives control signals from an external source convert those signals into parameters for control purposes.

As shown in the illustration above, cascade control can be achieved with the use of two controllers.

Ordering Information (Model Configurations)

(1)	Model		4	48×48						
			5	96×48						
			7	72×72						
				96×96						
2	Dutput 1		9 N	No		J	Voltage 0 to 5VDC			
			R	Relay point of contact		F	Voltage 1 to 5VDC			
			Р	Voltage for SSR driving		G	Voltage 0 to 10VDC			
			A	Open collector			Current 4 to 20mADC			
			K	Voltage 0 to 1VDC		Н	Voltage 0 to 10mVDC			
3	Output 2		N	No		J	Voltage 0 to 5VDC			
			R	Relay point of contact		F	Voltage 1 to 5VDC			
			Р	Voltage for SSR driving		G	Voltage 0 to 10VDC			
			A	Open collector		I	Current 4 to 20mADC			
			K	Voltage 0 to 1VDC		Н	Voltage 0 to 10mVDC			
4	Output 3、4		А	Open collector						
			R	Relay point of contact	Same for the remote c	Same for the remote controllers on all models				
5	Output 5, 6		А	Open collector	Not selectable for 214					
			R	Relay point of contact	217 cannot select output 6					
6	Output 7		А	Open collector Not selectable for 214						
			R	Relay point of contact Not selectable under TTM-217 when option W (DI3) is reauired.						
1	Al input		Y	Remote SV input (voltage/current only) Not selectable for TTM-214						
8	Option	214 Selection	ST	CT1,2						
			SV	CT1, DI2						
			UV	DI1, 2						
		217 Selection	ST	CT1, 2						
			SV	CT1, DI2						
			UV	D11, 2						
			STW	CT1, 2 DI3 (output 7 not selectable)						
			SVW	CT1, DI2, 3 (output 7 not selectable)						
	215, 219 Selection		UVW	DI1, 2, 3 (output 7 not selectable)						
			ST	CT1, 2						
			SV	CT1, DI2						
			UV	D11, 2						
			SVW	CT1, DI2, 3, 4						
			UVW	DI1, 2, 3, 4 CT1, 2 DI1, 2						
			STUV	CT1, 2 D11, 2 CT1, 2 D11, 2, 3, 4						
	Communication M			C I 1, 2 DI 1, 2, 3, 4 Communications (RS-485)						
9			М							
10	Power Supply	/		100 to 240V (free power)						
			L	24VAC/DC						

* Parameters up to output 2 must be selected.

* Specifications apply in accordance with the sequence of selection for output 3 and upwards.

- Example: TTM-219-PR-RUVW
 - P: Output 1: SSR drive voltage
 - R: Output 2: Relay connection
 - R: Output 3, 4: Relay connection (does not select output 5 and 6)
 - UVW: DI1, 2, 3, 4
 - \star Output 3 and 4 must be selected when output 5 and 6 are required.
 - \star Output 3 and 4 and output 5 and 6 must be selected when output 7 is required.
- * Option W only consists of DI3 when TTM-217 has been selected.
- (The option W under 215, 219 selection refers to DI3, 4.)
- \pm CTL-6-P-H is added when CT is selected. (2pcs are added when 2 CTs are selected.)
- * CT cannot be selected when only analog has been selected for the output.
