TET2200-12-086xA Series

AC-DC Front-End Power Supply

The TET2200-12-086 Series is a 2200 Watt AC-DC power-factor-corrected (PFC) and DC/DC power supply that converts standard AC mains power or high voltage DC bus voltages into a main output of 12 VDC for powering intermediate bus architectures (IBA) in high performance and reliability servers, routers, and network switches.

The TET2200-12-086 Series meets international safety standards and displays the CE-Mark for the European Low Voltage Directive (LVD).

RoHS Compliant

80 PLUS TITANIUM

Key Features & Benefits

- Best-in-class, 80 PLUS certified “Titanium” efficiency
- Wide input voltage range: 180 - 264 VAC / 2200 W,
  90 - 180 VAC /1200 W
- AC input with power factor correction
- Always-on 42 W standby output (12 V / 3.5 A)
- Hot-plug capability
- Parallel operation with active current sharing through analog bus
- Full digital controls for improved performance
- High density design: 53.1 W/in^3
- Small form factor: 86.3 x 39.3 x 196.5 mm (3.4 x 1.5 x 7.7 in)
- Up to 400 kHz
- I2C communication interface with Power Management Bus protocol for monitoring, control, and firmware update via bootloader
- Overtemperature, output overvoltage and overcurrent protection
- RoHS Compliant
- Status LED with fault signaling

Applications

- High Performance Servers
- Routers
- Switches

2. OVERVIEW

The TET2200-12-086 Series is a fully DSP controlled, highly efficient front-end power supply. It incorporates resonant-soft-switching technology and interleaved power trains to reduce component stresses, providing increased system reliability and very high efficiency. With a wide input operating voltage range and minimal linear derating of output power with respect to ambient temperature, the TET2200-12-86NA maximizes power availability in demanding server, switch, and router applications. The power supply is fan cooled and ideally suited for server integration with a matching airflow path.

The PFC stage is digitally controlled using a state-of-the-art digital signal processing algorithm to guarantee best efficiency and unity power factor over a wide operating range.

The DC-DC stage uses soft switching resonant techniques in conjunction with synchronous rectification. An active OR-ing device on the output ensures no reverse load current and renders the supply ideally suited for operation in redundant power systems. The always-on +12V standby output provides power to external power distribution and management controllers. Its protection with an active OR-ing device provides for maximum reliability.

Status information is provided with front-panel LED. In addition, the power supply can be monitored and controlled (i.e. fan speed setpoint) via I2C communication interface with Power Management Bus protocol. It allows full monitoring of the supply, including input and output voltage, current, power, and inside temperatures. The same I2C bus supports the bootloader to allow field update of the firmware in the DSP controllers.

Cooling is managed by a fan, controlled by the DSP controller. The fan speed is adjusted automatically depending on the actual power demand and supply temperature and can be overridden through the I2C buses.

3. ABSOLUTE MAXIMUM RATINGS

Stresses in excess of the absolute maximum ratings may cause performance degradation, adversely affect long-term reliability and cause permanent damage to the supply.

PARAMETER		CONDITIONS / DESCRIPTION	MIN	MAX	UNITS
Vi maxc	Maximum Input	Continuous		264	VAC

4. INPUT

General Condition: T_A = 0…+55 °C, unless otherwise noted.

PARAMETER		DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
$V_{i\,nom}$	AC Nominal Input Voltage		100	230	240	VAC
V_i	AC Input Voltage Ranges	Normal operating ($V_{i\,min}$ to $V_{i\,max}$)	90		264	VAC
$V_{i\,nom\,DC}$	DC Nominal Input Voltage	Rated HVDC		240		VDC
$V_{i\,DC}$	DC Input Voltage Ranges	Normal operating ($V_{i\,min}$ to $V_{i\,max}$)	180		300	VDC
$V_{i\,derated}$	Derated Input Voltage Range	See section 10.3	90		180	VAC
$I_{i\,max}$	Max Input Current	V_i > 200 VAC, >100 VAC			15	A_{rms}
$I_{i\,p}$	Inrush Current Limitation	*$V_{i\,min}$ to $V_{i\,max}$, T_{NTC} = 25°C (See Figure 2)*			35	A_p
F_i	Input Frequency		47	50/60	63	Hz
PF	Power Factor	$V_{i\,nom}$, 50Hz, > 0.2 $I_{i\,nom}$	0.95	0.96		W/VA

$V_{i\,off}$	Turn-off Input Voltage[2)]	Ramping down	79	82	85	VAC
η	Efficiency Without Fan	V_i = 230 VAC, 0.1·$I_{x\,nom}$, $V_{x\,nom}$, T_A = 25°C	90			%
		V_i = 230 VAC, 0.2·$I_{x\,nom}$, $V_{x\,nom}$, T_A = 25°C	94			
		V_i = 230 VAC, 0.5·$I_{x\,nom}$, $V_{x\,nom}$, T_A = 25°C	96			
		V_i = 230 VAC, $I_{x\,nom}$, $V_{x\,nom}$, T_A = 25°C	91			
T_{hold}	Hold-up Time	After last AC 45C degree (Worst case), V_i > 11.7V, V_{SB} within regulation, V_i = 230 VAC, 0.7$P_{x\,nom}$	10	11		ms

[2)] The Front-End is provided with a typical hysteresis of 5 V during turn-on and turn-off within the ranges.

4.1 INPUT FUSE

Quick-acting 20 A input fuses (5.4 × 22.5 in mm) in series with the L-line inside the power supply protect against severe defects. The fuses are not accessible from the outside and are therefore not serviceable parts.

4.2 INRUSH CURRENT

The AC-DC power supply exhibits an X-capacitance of only 3.88 µF, resulting in a low and short peak current, when the supply is connected to the mains. The internal bulk capacitor will be charged through a PTC which will limit the inrush current.

NOTE: Do not repeat plug-in / out operations below 5 sec interval time at maximum input, high temperature condition, or else the internal in-rush current limiting device PTC may not sufficiently cool down and excessive inrush current or component failure(s) may result.

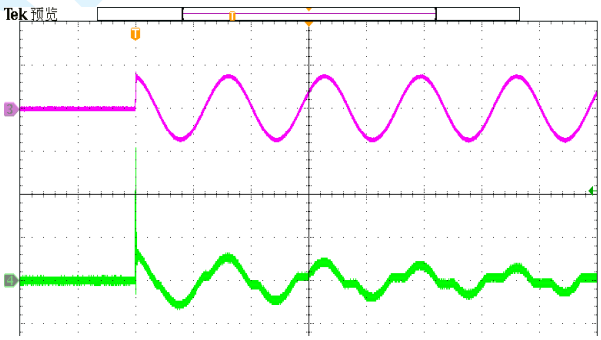

Figure 2. Inrush current, Vin = 264Vac, 90°
CH3: Vin (500V/div), CH4: Iin (10A/div)

4.3 INPUT UNDER-VOLTAGE

If the RMS value of input voltage (either AC or DC) stays below the input undervoltage lockout threshold $V_{i\,on}$, the supply will be inhibited. Once the input voltage returns within the normal operating range, the supply will return to normal operation again.

4.4 POWER FACTOR CORRECTION

Power factor correction (PFC) (see *Figure 3*) is achieved by controlling the input current waveform synchronously with the input voltage. A fully digital controller is implemented giving outstanding PFC results over a wide input voltage and load ranges. The input current will follow the shape of the input voltage. If for instance the input voltage has a trapezoidal waveform, then the current will also show a trapezoidal waveform. At DC input voltage the PFC is still in operation, but the input current will be DC in this case.

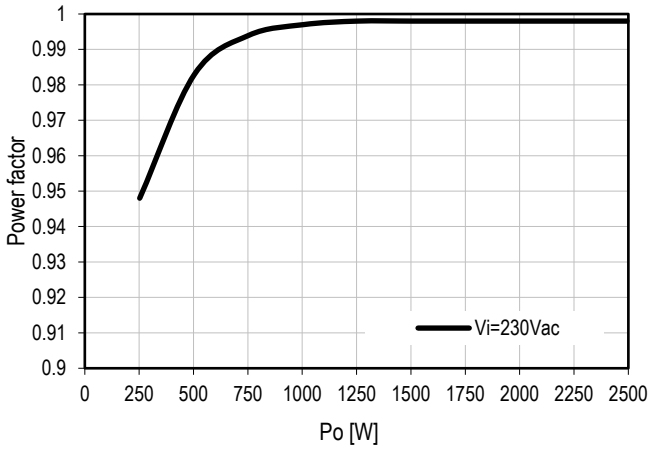

Figure 3. Power Factor vs. Load

4.5 EFFICIENCY

The high efficiency (see *Figure 4*) is achieved by using state-of-the-art GaN power devices in conjunction with soft-transition topologies minimizing switching losses and a full digital control scheme. Synchronous rectifiers on the output reduce the losses in the high current output path. The rpm of the fan is digitally controlled to keep all components at an optimal operating temperature regardless of the ambient temperature and load conditions.

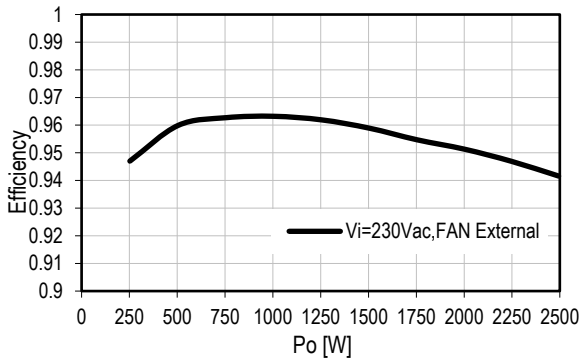

Figure 4. Efficiency vs. Load

5. OUTPUT

General Condition: Ta = 0… +55°C unless otherwise specified.

PARAMETER		DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
Main Output V_1

5.1 OUTPUT VOLTAGE RIPPLE

Ripple and noise shall be measured using the following methods:

a) Outputs bypassed at the point of measurement with a parallel combination of 10µF tantalum capacitor in parallel with 0.1µF ceramic capacitors, referring the setup in *Figure 19.*

b) The ripple voltage is measured with 20 MHz BWL.

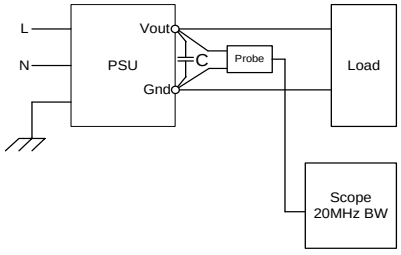

Figure 19. Output Ripple Test Setup

5.2 SHORT TIME OVERLOAD

The main output has the capability to allow load current up to 40% above the nominal output current rating for a maximum duration of 20ms. This allows the system to consume extended power for short time dynamic processes.

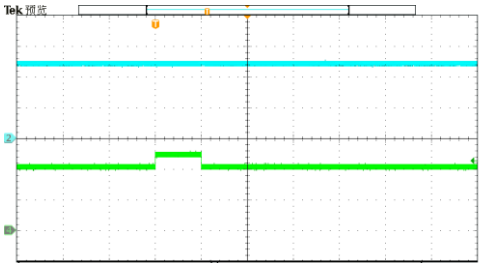

Figure 20. Short circuit on V1 (20ms/Div)
CH2: V_1 (5V/div) CH4: Vin (100A/div)

5.3 OUTPUT GROUND / CHASSIS CONNECTION

The output return path serves as power and signal ground. All output voltages and signals are referenced to these pins. To prevent a shift in signal and voltage levels due to ground wiring voltage drop a low impedance ground plane should be used as shown in *Figure 21*. Alternatively, separated ground signals can be used as shown in *Figure 22*. In this case the two ground planes should be connected at the power supplies ground pins.

NOTE: Within the power supply the output GND pins are connected to the Chassis, which in turn is connected to the Protective Earth terminal on the AC inlet. Therefore, it is not possible to set the potential of the output return (GND) to any other than Protective Earth potential.

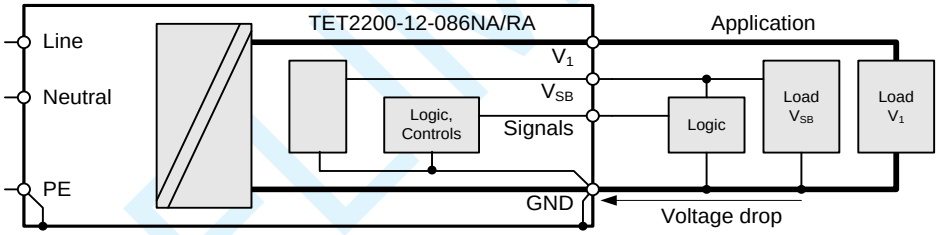

Figure 21. Common Low Impedance Ground Plane

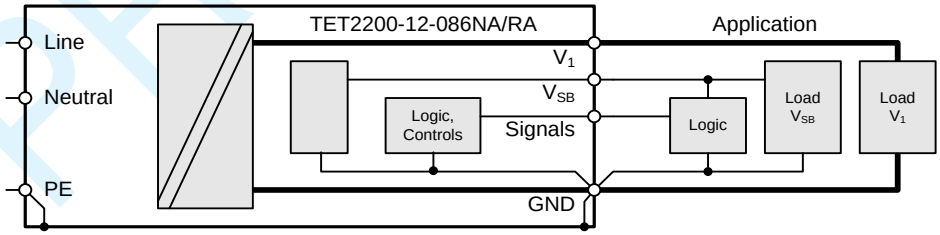

Figure 22. Separated Power and Signal Ground

6. PROTECTION SPECIFICATIONS

PARAMETER		DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT

[3] Limit set doesn't include effects of main output capacitive discharge.

6.1 OVERVOLTAGE PROTECTION

The TET2200-12-086 Series front-end provides a fixed threshold overvoltage (OV) protection implemented with a HW comparator for both the main and the standby output. Once an OV condition has been triggered on the main output, the supply will shut down and latch the fault condition. The latch can be unlocked by disconnecting the supply from the AC mains or by toggling the PSON_L input. The standby output will continuously try to restart with a 1 s interval after OV condition has occurred.

6.2 UNDERVOLTAGE DETECTION

Both main and standby outputs are monitored. PWOK pin signal if the output voltage exceeds ±5% of its nominal voltage.
The main output will latch off if the main output voltage when V1 falls below 11.2V (typically in an overload condition), the latch can be unlocked by disconnecting the supply from the AC mains or by toggling the PSON_L input.
If the standby output leaves its regulation bandwidth for more than 10ms then the main output is disabled to protect the system, and the standby output will continuously try to restart with a 1s interval after UV condition has occurred.

7. SIGNALING AND CONTROL

8.1 ELECTRICAL CHARACTERISTICS (INPUT SIGNALS)

All Input signals versus signal ground SGND pin of output connector in PSU

PARAMETER		DESCRIPTION	MIN	NOM	MAX	UNIT
PSKILL / PSON_L inputs						
V_{IL}	Input low level voltage	Main output enabled	-0.2		0.5	V
V_{IH}	Input high level voltage	Main output disabled	2.0		5.25	V
$I_{IL, H}$	Maximum input sink or source current	VI = -0.2V to +3.5V			4	mA
$R_{puPSKILL}$	Internal pull up resistor to internal 3.3V on PSKILL			10		kΩ
R_{puPSON_L}	Internal pull up resistor to internal 3.3V on PSON_L			10		kΩ

Table 2. Input signals

8.1.1 PSKILL INPUT

The PSKILL input is an active-high and normally a trailing pin in the connector and is used to disconnect the main output as soon as the power supply is being plugged out. This pin should be connected to SGND on the system. The standby output will remain on regardless of the PSKILL input state.

8.1.2 PSON_L INPUT

The PSON_L is an internally pulled- up (3.3V) input signal via 10kohm resistor to enable / disable the main output V1 of the front-end. This active-low pin is also used to clear any latched fault condition. Figure 26 shows PSON_L circuit used in PSU and proposed connections.

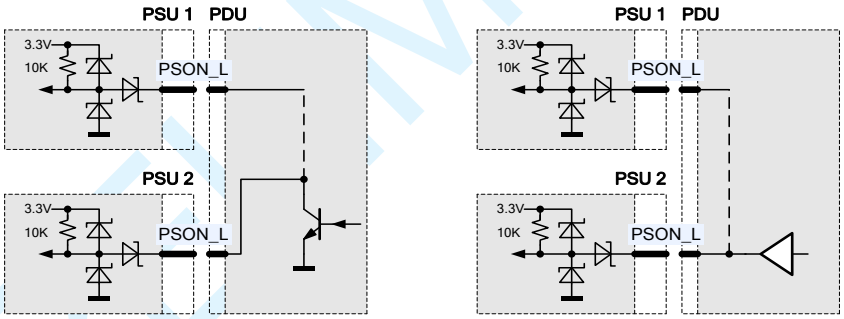

Figure 26. PSON_L Connection

8.1.3 SENSE INPUTS

The main output has sense lines implemented to compensate for voltage drop on load wires in both positive and negative path. The maximum allowed voltage drop is 200 mV on the positive rail and 50 mV on the GND rail.

With open sense inputs the main output voltage will rise by 250 mV. Therefore, if not used, these inputs should be connected to the power output and GND at the power supply connector. The sense inputs are protected against short circuit. In this case the power supply will shut down.

8.2 ELECTRICAL CHARACTERISTICS (OUTPUT SIGNALS)

All Output signals versus signal ground SGND in PSU.

PARAMETER	DESCRIPTION		MIN	NOM	MAX	UNIT

Low level output	PSU is present					
High level output	PSU is not present					

Table 3. Output signals

8.2.1 PWOK

PWOK is a power OK signal and will be pulled HIGH by the power supply to indicate that all the outputs are within the regulation limits of the power supply. When any output voltage falls below regulation limits or when AC power has been removed for a time sufficiently long so that power supply operation is no longer guaranteed, PWOK will be de-asserted to a LOW state.

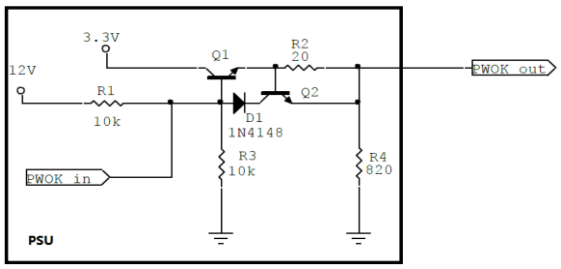

Figure 27. PWOK circuit in PSU

8.2.2 ACOK

The ACOK is an internal pull-up to 3.3V via 1kohm resistor indicating whether the input is within the range the power supply can use and turn on. A 15V zener diode is added on this signal pin versus signal ground SGND to protect internal circuits from negative and high positive voltage. The ACOK signal is active-high.

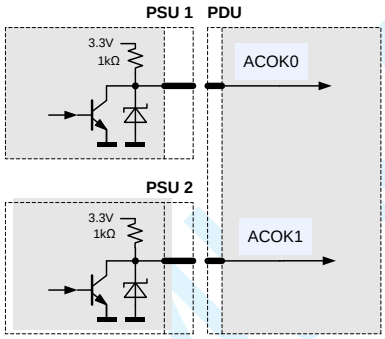

Figure 28. ACOK Connection

8.2.3 SMB_ALERT_L

The SMB_ALERT_L an internal pull-up to 3.3V via 10kohm resistor indicating the power supply is experiencing a problem that the system agent should investigate. This is a logical OR of the Shutdown and Warning events. It is asserted (pulled Low) at Shutdown or Warning events such as reaching temperature warning/shutdown threshold of critical component, general failure, over-current, over-voltage, under-voltage or low-speed of failed fan. This signal may also indicate the power supply is operating in an environment exceeding the specified limits. This signal is to be asserted in parallel with LED turning solid Amber.

The power supply shall assert the over temperature SMB_ALERT_L signal when a hot spot or inlet temperature sensor crosses a warning threshold. The inlet temperature warning threshold must be set at 57.5°C(NA) and 62°C(RA), preventing exhaust air and cord temperatures temperature exceeding safety ratings. The warning gets deserted once inlet air temperature returns into specified operating temperature range. Fan speed control algorithm shall ramp up the fan speed to the maximum prior to the SMB_ALERT_L insertion. A 15V zener diode is added on this signal pin versus signal ground SGND to protect internal circuits from negative and high positive voltage.

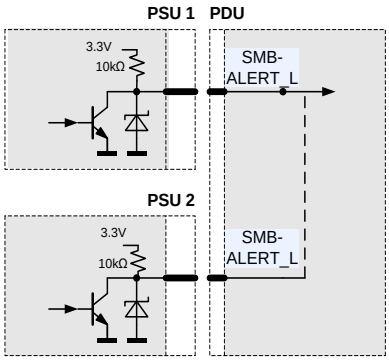

Figure 29. SMB_ALERT_L Connection

8.2.4 PRESENT_L OUTPUT

The PRESENT_L pin is wired to internal SGND within the power supply. This pin does indicate that there is a power supply present in this system slot. An external pull-up resistor has to be added within the application. Current into PRESENT_L should not exceed 4 mA to guarantee a low level voltage if power supply is seated.

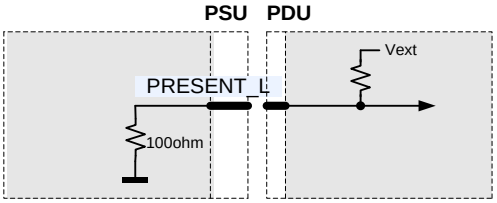

Figure 30. PRESENT_L Signal Pin

8.3 ELECTRICAL CHARACTERISTICS (BIDIRECTIONAL SIGNALS)

8.3.1 CURRENT SHARE

All Output signals versus signal ground SGND in PSU

The TET front-ends have an active current share scheme implemented for V1. All the ISHARE current share pins need to be interconnected in order to activate the sharing function. If a supply has an internal fault or is not turned on, it will disconnect its ISHARE pin from the share bus. This will prevent dragging the output down (or up) in such cases.

The current share function uses an analog bus to transmit and receive current share information. The controller implements a Master/Slave current share function. The power supply providing the largest current among the group is automatically the Master. The other supplies will operate as Slaves and increase their output current to a value close to the Master by slightly increasing their output voltage. The voltage increase is limited to +250 mV. The output will share within 5% at full load.

ISHARE pins must be interconnected without any additional components. This in-/output has a 15 V zener diode as a protection device and is disconnected from internal circuits when the power supply is switched off.

The 12VSB output is not required to actively share current between power supplies (passive sharing).

No of paralleled PSUs	Maximum available power on main 12V without redundancy	Maximum available power on main 12V with n+1 redundancy	Maximum available power standby output
1	2200 W	-	42 W
2	4290 W	2200 W	42 W
3	6435 W	4290 W	42 W
4	8580 W	6435 W	42 W
5	10725 W	8580 W	42 W
6	12870 W	10725 W	42 W

Table 4. Power Available When PSU in Redundant Operation

8.4 FRONT LEDS

The front-end has 1 front LED showing the status of the supply. LED is bi-colored: green and yellow, and indicates DC power presence or fault situations. For the position of the LED see *Table* lists the different LED status.

OPERATING CONDITION	LED State
Output ON and OK	Solid GREEN
No AC power to all power supplies	OFF
AC cord unplugged, or AC power lost; with a second power supply in parallel still with AC input power.	OFF
AC present / Only 12 VSB on (Standby mode)	0.5 Hz Blink GREEN
Sleep PS in Smart redundant state/off line mode	2 Hz Blink GREEN
Power supply critical event causing a shutdown; eg. OCP, OVP, OTP, Fan Fail	Solid AMBER
Power supply in FW upload mode	2 Hz Blink GREEN

Table 5. LED Status

8.5 SIGNAL TIMING

OPERATING CONDITION		MIN	MAX	UNIT
$t_{AC\ VSB}$	AC Line to 90% V_{VSB}		2	sec
$t_{AC\ V1}$	AC Line to 90% V_1		2	sec
$t_{ACOK\ on1}$	ACOK signal on delay (start-up)		1700	ms
$t_{ACOK\ on2}$	ACOK signal on delay (dips)	0	100	ms
$t_{V1\ holdup}$	Effective V_1 holdup time Po<0.7$P_{x\ nom}$ Effective V_1 holdup time Po>0.7$P_{x\ nom}$	10 8	300 300	ms
$t_{VSB\ holdup}$	Effective V_{SB} holdup time	40	300	ms
$t_{ACOK\ V1}$	ACOK to V_1 holdup Po<0.7$P_{x\ nom}$ ACOK to V_1 holdup Po>0.7$P_{x\ nom}$	7 5		ms
$t_{ACOK\ VSB}$	ACOK to V_{SB} holdup	25		ms
$t_{V1\ off}$	Minimum V_1 off time	500		ms
$t_{VSB\ off}$	Minimum V_{SB} off time	500		ms
$t_{V1dropout}$	Minimum V_1 dropout time	10		ms
$t_{VSBdropout}$	Minimum V_{SB} dropout time	40		ms
$t_{V1\ rise}$	V_1 rise time		20	ms
$t_{VSB\ rise}$	V_{SB} rise time		20	ms
$t_{PSON\_L\ V1on}$	PSON_L to V_1 Delay (on)	5	350	ms
$t_{PSON\_L\ V1off}$	PSON_L to V_1 Delay (off)	0	100	ms
$t_{PWOK\ del}$	V_1 to PWOK Delay (on)	100	500	ms
$t_{PWOK\ warn}$	PWOK Delay (off) to V_1 <11.7 V at Po<0.7$P_{x\ nom}$	1		ms
	PWOK Delay (off) to V_1 <11.7 V at Po>0.7$P_{x\ nom}$	-1		ms

8.6 I2C / POWER MANAGEMENT BUS COMMUNICATION

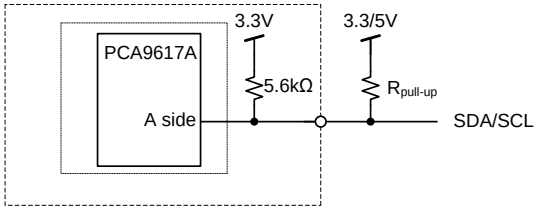

Figure 35. Physical Layer of Communication Interface

The TET front-end is a communication Slave device only; it never initiates messages on the I2C/SMBus by itself. The communication bus voltage and timing is defined in *Table 7* further characterized through:

- The SDA/SCL IOs use 3V3 logic levels
- External pull-up resistors on SDA/SCL required for correct signal edges
- Full SMBus clock speed of 400 kbps
- Clock stretching limited to 1 ms
- SCL low time-out of >25 ms with recovery
- within 10 ms
- Recognizes any time Start/Stop bus conditions

Communication to the DSP or the EEPROM will be possible as long as the input AC voltage is provided. If no AC is present, communication to the unit is possible if it is connected to a life 12V or 12VSB output (provided e.g. by the redundant unit).

PARAMETER	DESCRIPTION	CONDITION	MIN	MAX	UNIT
SCL / SDA					
V_{iL}	Input low voltage		-0.5	1.0	V
V_{iH}	Input high voltage		2.3	3.5	V
V_{hys}	Input hysteresis		0.15		V
V_{oL}	Output low voltage	3 mA sink current	0	0.4	V
t_r	Rise time for SDA and SCL		$20+0.1C_b$[1]	300	ns
t_{of}	Output fall time ViHmin → ViLmax	10 pF < C_b[1] < 400 pF	$20+0.1C_b$[1]	250	ns
I_i	Input current SCL/SDA	0.1 VDD < Vi < 0.9 VDD	-10	10	µA
C_i	Internal Capacitance for each SCL/SDA			0	pF
f_{SCL}	SCL clock frequency		0	400	kHz
$R_{pull-up}$	External pull-up resistor	f_{SCL} ≤ 400 kHz		1000 ns / C_b[1]	Ω
t_{HDSTA}	Hold time (repeated) START	f_{SCL} ≤ 400 kHz	0.6		µs
t_{LOW}	Low period of the SCL clock	f_{SCL} ≤ 400 kHz	1.3		µs
t_{HIGH}	High period of the SCL clock	f_{SCL} ≤ 400 kHz	0.6		µs
t_{SUSTA}	Setup time for a repeated START	f_{SCL} ≤ 400 kHz	0.6		µs
t_{HDDAT}	Data hold time	f_{SCL} ≤ 400 kHz	0	0.9	µs
t_{SUDAT}	Data setup time	f_{SCL} ≤ 400 kHz	100		ns
t_{SUSTO}	Setup time for STOP condition	f_{SCL} ≤ 400 kHz	0.6		µs
t_{BUF}	Bus free time between STOP and START	f_{SCL} ≤ 400 kHz	1		ms

[1] Cb = Capacitance of bus line in pF, typically in the range of 10…400 pF

Table 7. I2C / SMBus Specification

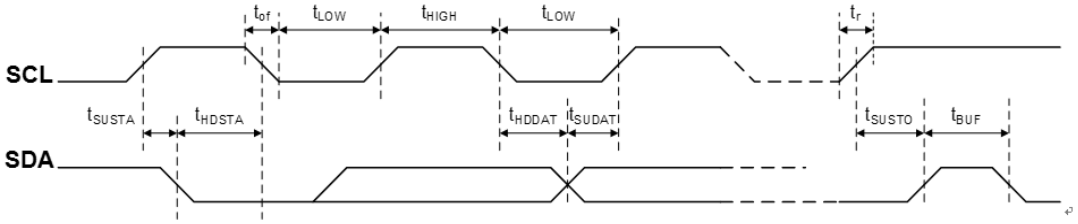

Figure 36. I2C / SMBus Timing

ADDRESS SELECTION

The address for I2C communication can be configured by pulling address input pins A0,A1 and A2 either to GND (Logic Low) or leave them open (Logic High). An internal pull up resistor (10kohm) will cause the A0, A1 and A2 pin to be in High Level if left open. A fixed addressing offset exists between the Controller and the EEPROM.

I2C ADDRESS

A2	A1	A0	I2C Address	
			Power Management Bus Address	EEPROM Address
0	0	0	0xB0	0xA0
0	0	1	0xB2	0xA2

Table 8. Address and Protocol Encoding

8.7 CONTROLLER AND EEPROM ACCESS

The controller and the EEPROM in the power supply share the same I2C bus physical layer (see *Figure* 37) and can be accessed under different addresses, see *Table 8 Address and Protocol Encoding*.

The SDA/SCL lines are connected directly to the controller and EEPROM which are supplied by internal 3V3.

The EEPROM provides 256 bytes of user memory. None of the bytes are used for the operation of the power supply.

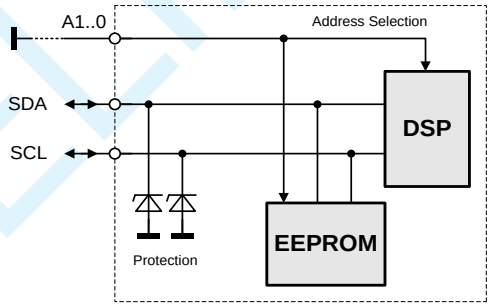

Figure 37. I2C Bus to DSP and EEPROM

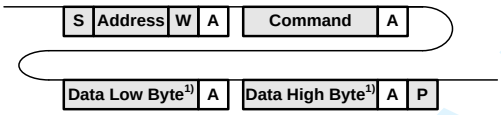
8.9 POWER MANAGEMENT BUS PROTOCOL

The Power Management Bus is an open standard protocol that defines means of communicating with power conversion and other devices. For more information, please see the System Management Interface Forum web site at: www.powerSIG.org. Power Management Bus command codes are not register addresses. They describe a specific command to be executed. TET2200-12-086 Series supply supports the following basic command structures:

- Clock stretching limited to 1 ms
- SCL low time-out of >25 ms with recovery within 10 ms
- Recognized any time Start/Stop bus conditions

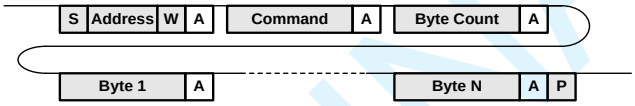
WRITE

The write protocol is the SMBus 1.1 Write Byte/Word protocol. Note that the write protocol may end after the command byte or after the first data byte (Byte command) or then after sending 2 data bytes (Word command).



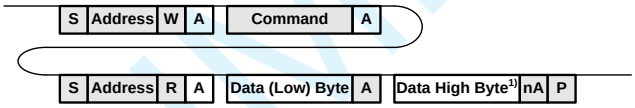
1) Optional

In addition, Block write commands are supported with a total maximum length of 255 bytes. See TET2200-12-086 Series Programming Manual for further information.



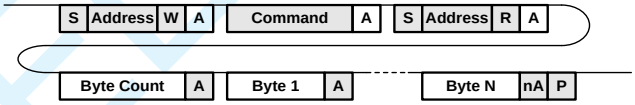
READ

The read protocol is the SMBus 1.1 Read Byte/Word protocol. Note that the read protocol may request a single byte or word.



1) Optional

In addition, Block read commands are supported with a total maximum length of 255 bytes. See TET2200-12-086 Series Power Management Bus Communication Manual URP.00560 for further information.



8. MECHANICAL SPECIFICATIONS

PARAMETER		DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
	Dimensions	Width		86.3		mm
		Height		39.3		
		Depth		196.5		
M	Weight			1.2		kg

NOTE: A 3D step file of the power supply casing is available on request.

9. TEMPERATURE AND FAN CONTROL

10.1 FAN CONTROL

To achieve best cooling results sufficient airflow through the supply must be ensured. Do not block or obstruct the air-flow at the rear of the supply by placing large objects directly at the output connector. The TET2200-12-086NA is provided with a rear to front airflow, which means the air enters through the DC-output of the supply and leaves at the AC-inlet and TET2200-12-086RA is reversed. The fan inside of the supply is controlled by a microprocessor. The rpm of the fan is adjusted to ensure optimal supply cooling and is a function of output power and the inlet temperature.

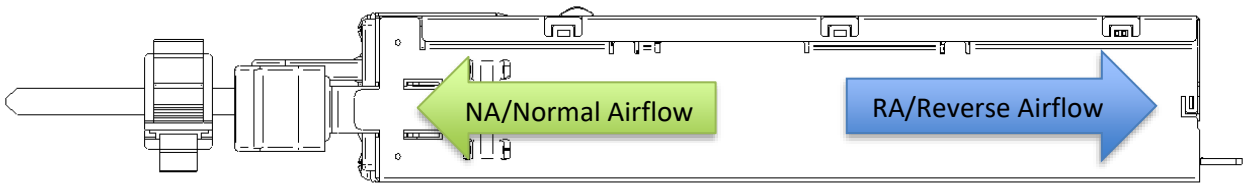

Figure 40. Airflow Direction

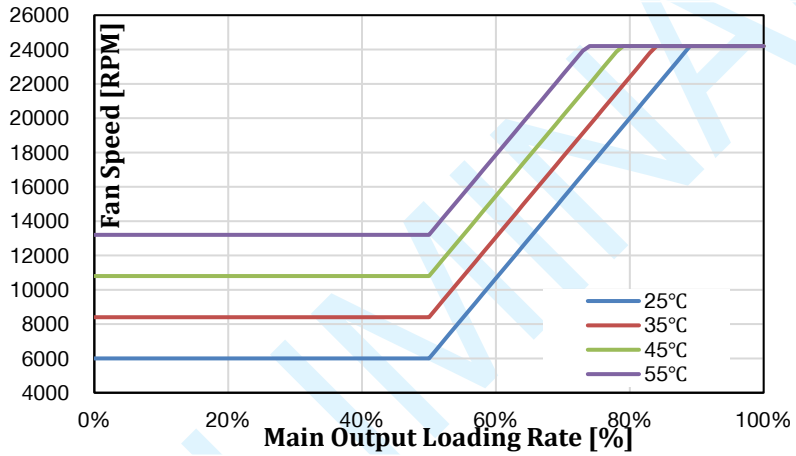

Figure 41. Fan Speed vs. Main Output Load

10.2 TEMPERATURE MONITOR AND OVER TEMPERATURE PROTECTION

The TET2200-12-086 Series provides access via I2C to the measured temperatures of in total 4 sensors within the power supply, see *Table* 9. The microprocessor is monitoring these temperatures and if warning threshold of one of these sensors is reached it will set fan to maximum speed. If temperatures continue to rise above shut down threshold the main output V1 (or VSB if auxiliary converter is affected) will be disabled. At the same time the warning or fault condition is signalized accordingly through LED, PWOK and SMB_ALERT_L.

TEMPERATURE SENSOR	DESCRIPTION / CONDITION	POWER MANAGEMENT BUS REGISTER	WARNING THRESHOLD	SHUT DOWN THRESHOLD
Inlet air temperature	Sensor located on inlet	0x8D	NA:65C RA:60C	NA:70C RA:65C
Oring Mosfet	Sensor located close to Oring Mosfet	0x8E	NA:100C RA:115C	NA:105C RA:120C
Outlet air temperature	Sensor located on outlet	0x8F	NA:85C RA:90C	NA:90C RA:95C
PFC&DC-DC heat sink	Sensor located on PFC heatsink and DC-DC heatsink			NA: 130C RA: 130C

11. SAFETY / APPROVALS

Maximum electric strength testing is performed in the factory according to IEC/EN 60950, and UL 60950. Input-to-output electric strength tests should not be repeated in the field. Bel Power Solutions will not honor any warranty claims resulting from electric strength field tests.

Table 12. Safety/Approvals

12. ENVIRONMENTAL

Power supply shall meet the thermal requirements under the load and environmental condition identified in each table. Even though the table addresses only the exhaust air temperature, all other components in the power supply shall also meet their temperature specifications and lifetime requirements.
The power supply must meet UL enclosure requirements for temperature rise limits. All sides of the power supply with exception to the air exhaust side must be classified as “Handle, knobs, grips, etc. held for short periods of time only”.
In case the exit air temperature requirement cannot be met, the power supply must have a warning label for high touch temperature in compliance with IEC/UL 60950-1 and additionally 85°C rated power cords must also be used with this power supply.

PARAMETER		DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
T_A	Ambient Temperature	$V_{in\,min}$ to $V_{in\,max}$, $I_{o\,nom}$, $I_{SB\,nom}$ at 5000 m	0		+50	°C
		$V_{in\,min}$ to $V_{in\,max}$, $I_{o\,nom}$, $I_{SB\,nom}$ at 2000 m	0		+55	°C
T_{Aext}	Extended Temp. Range	Derated output at 2000 m	+50		+60	°C
T_S	Storage Temperature	Non-operational	-40		+70	°C
