

CPI2-B1-STM8 – universal programmer

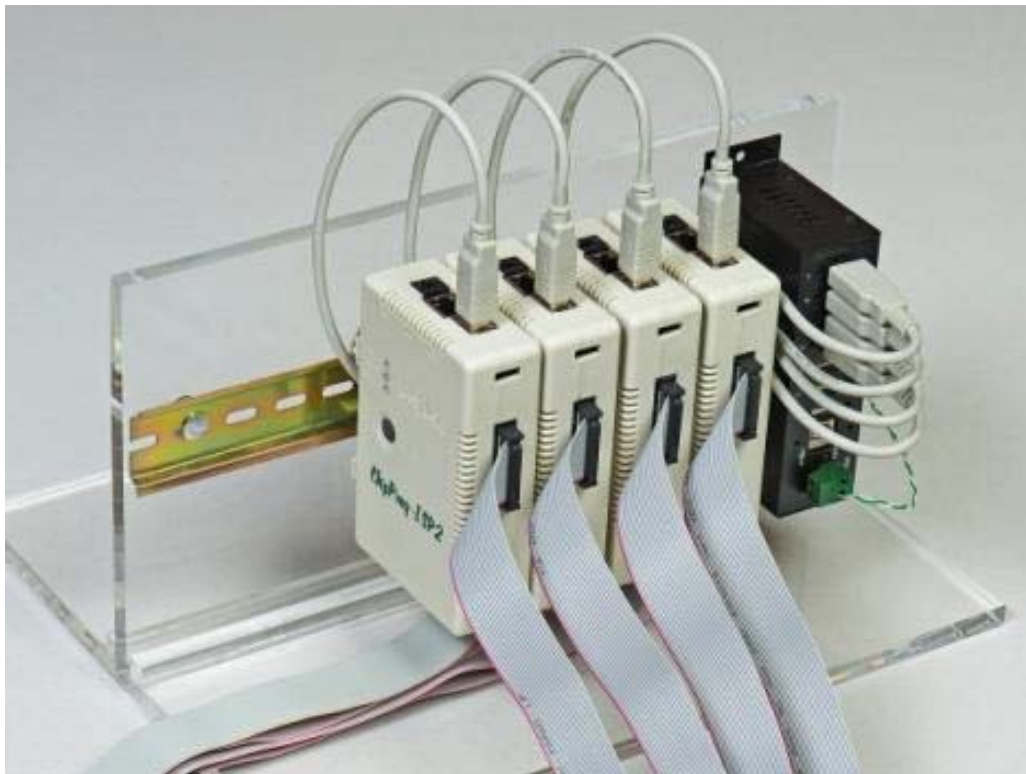

CPI2-B1-STM8 in-system device programmer

This **preloaded** device programmer bundles a standard **CPI2-B1** single-channel device programmer with a device library license that enables programming of a variety of ST Microelectronics ST7 and STM8 devices currently supported by Phyton. See a list of the preinstalled device library licenses in the matrix below. Plus, as any other preloaded device programmers, this bundle includes the free **Basic Device Library** license.

The CPI2-B1-STM8 device programmer will automatically enable programming of all new devices belonging to the ST Microelectronics ST7 and STM8 device library below that Phyton will support in the future – no new purchase is required.

To expand the CPI2-B1-STM8 device list, additional **CPI2-D-xxxx** device library licenses, not included in the CPI2-B1-STM8 bundle, can be purchased and installed by the programmer's user.

Bundled licenses	Description
Basic License	Free Basic Device Library license that supports all serial flash memory devices and selected 8- and 16-bit microcontrollers from different manufacturers
CPI2-D-STM8	ST Microelectronics ST7/STM8 device library license
