

DC-DC Front-End Power Supply

The PET1600-12-074xD is a 1600 Watt DC to DC power supply that converts -40 to -72 VDC voltage into an isolated main output of +12 VDC for powering intermediate bus architectures (IBA) in high performance and reliability servers, routers, and network switches.

The PET1600-12-074xD utilizes full digital control architecture for greater efficiency, control, and functionality.

This power supply meets international safety standards.

Key Features & Benefits

- Best-in-class, "Platinum" equivalent efficiency
- Wide input voltage range: -40 to -72 VDC
- Always-On 12 V / 3 A / 36 W standby output
- Hot-plug capable
- Parallel operation with active current sharing
- Full digital controls for improved performance
- High density design: 34 W/in³
- Small form factor: 265 x 73.5 x 40.0 mm (10.43 x 2.89 x 1.57 in)
- Power Management Bus communication protocol for control, programming and monitoring
- Status LED with fault signaling

Applications

- Networking Switches
- Servers & Routers
- Telecommunications

2. OVERVIEW

The PET1600-12-074xD DC-DC power supply is a fully DSP controlled, highly efficient front-end power supply. It incorporates state-of-the art technology and uses an interleaved forward converter topology with active clamp and synchronous rectification to reduce component stresses, thus providing increased system reliability and very high efficiency.

With a wide input DC voltage range the PET1600-12-074xD maximizes power availability in demanding server, network, and other high availability applications. The supply is fan cooled and ideally suited for integration with a matching airflow path.

An active OR-ing device on the output ensures no reverse load current and renders the supply ideally suited for operation in redundant power systems.

The always-on standby output provides power to external power distribution and management controllers. It is protected with an active OR-ing device for maximum reliability.

Status information is provided with a front-panel LED. In addition, the power supply can be controlled and the fan speed set via the I²C bus. The I²C bus allows full monitoring of the supply, including input and output voltage, current, power, and inside temperatures. Cooling is managed by a fan controlled by the DSP controller. The fan speed is adjusted automatically depending on the actual power demand and supply temperature and can be overridden through the I²C bus.

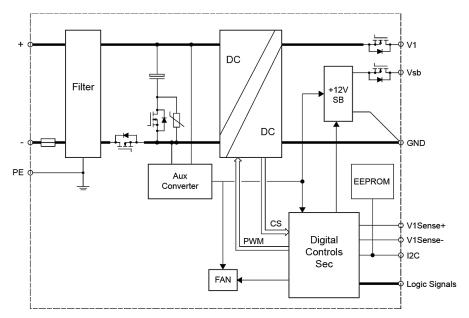

Figure 1. Block Diagram

3. ABSOLUTE MAXIMUM RATINGS

Stresses in excess of the absolute maximum ratings may cause performance degradation, adversely affect long-term reliability and cause permanent damage to the supply.

PARAMETER		CONDITIONS / DESCRIPTION	MIN	MAX	UNITS
Vi max	Maximum Input Voltage	Continuous		-72	VDC

4. INPUT

General Condition: T_A = -5...45 °C (PET1600-12-074RD), T_A = -5...55 °C (PET1600-12-074ND), unless otherwise noted.

PARAMETI	ER	DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
Vi start	Minimum Operating Input Voltage	Stand-by output available, DSP running				VDC
Vi nom	Nominal Input Voltage		-48	-53	-60	VDC
Vi	Input Voltage	Normal operation (from Vi min to Vi max)	-40		-72	VDC
li	Input Current	Vi > Vi min			47	Α

		Vi = -48 VDC; 100% load		93		%
Thold_V1	Hold-Up Time V1	$T_A = 25$ °C, Vi = -48 VDC; I_1 =133 A, $I_{SB\ nom}$, C_{ext} = 2200 μF	5	6		ms
Thold_Vsb	Hold-Up Time Vsb	$T_A = 25$ °C, Vi = -48 VDC; I_1 =133 A, $I_{SB nom}$, C_{ext} = 2200 μ F	6			ms

4.1 INPUT FUSE

A fast-acting 80 A input fuse in the negative voltage path inside the power supply protect against severe defects. The fuse is not accessible from the outside and are therefore not serviceable parts.

4.2 INRUSH CURRENT

Internal bulk capacitors will be charged through resistors connected from bulk cap minus pin to the DC rail minus, thus limiting the inrush current. After the inrush phase, NTC resistors are then shorted with MOSFETs connected in parallel. The Inrush control is managed by the digital controller (DSP).

4.3 INPUT UNDER-VOLTAGE

If the value of input DC voltage stays below the input under voltage lockout threshold Vi on, the supply will be inhibited. Once the input voltage returns within the normal operating range, the supply will return to normal operation again. If the input voltage stays below the input undervoltage lockout threshold Vi on, the supply will be inhibited. Once the input voltage returns within the normal operating range, the supply will return to normal operation again.

North America +1 408 785 5200

7. OUTPUT GROUND / CHASSIS CONNECTION

The output return path serves as power and signal ground. All output voltages and signals are referenced to these pins. To prevent a shift in signal and voltage levels due to ground wiring voltage drop a low impedance ground plane should be used as shown in *Figure 3*. Alternatively, separated ground signals can be used as shown in *Figure 4*. In this case the two ground planes should be connected together at the power supplies ground pins.

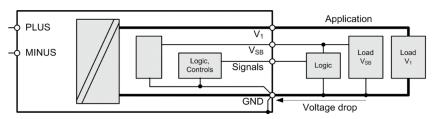

Figure 3. Common low impedance ground plane

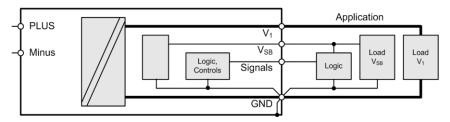

Figure 4. Separated power and signal ground

Due the unit has no Input Earth Connector Terminal on the front of the unit it is mandatory to have a reliable system output GND to Earth connection.

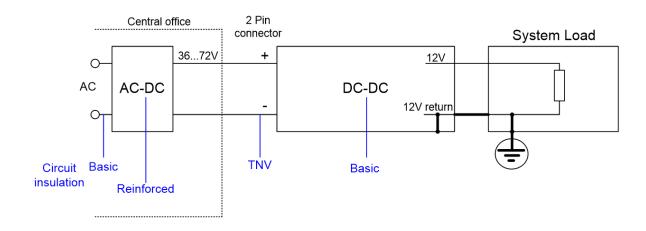

Figure 5. Block diagram with reliable System Earth connection

8. PROTECTION

General Condition: T_A = 0...45 °C (PET1600-12-074RD), T_A = 0...55 °C (PET1600-12-074ND), unless otherwise noted.

8.1 OVERVOLTAGE PROTECTION

The PET1600-12-074xD front-end provides a fixed threshold overvoltage (OV) protection implemented with a HW comparator for both the main and the standby output. Once an OV condition has been triggered on the main output, the supply will shut down and latch the fault condition. The latch can be unlocked by disconnecting the supply from the DC supply or by toggling the PSON_L input. The standby output will continuously try to restart with a 1 s interval after OV condition has occurred.

8.2 UNDERVOLTAGE DETECTION

Both main and standby outputs are monitored. LED and PWOK_H will change if the output voltage exceeds regulation band. The main output will latch off if the main output voltage V_1 falls below 10 V (typically in an overload condition) for more than 55 ms. The latch can be unlocked by disconnecting the supply from the DC supply or by toggling the PSON_L input. If the standby output leaves its regulation bandwidth for more than 2 ms then the main output is disabled to protect the system.

8.3 CURRENT LIMITATION

MAIN OUTPUT

The main output exhibits a substantially rectangular output characteristic controlled by a software feedback loop. If output current exceeds $I_{VI\ OC\ Fast}$ it will reduce output voltage in order to keep output current at $I_{VI\ OC\ Fast}$. If the output voltage drops below ~10.0 VDC for more than 55 ms, the output will latch off (standby remains on).

The latch can be unlocked by disconnecting the supply from the DC mains or by toggling the PSON_L input. The main output current limitation thresholds depend on the actual input applied to the power supply.

STANDBY OUTPUT

The standby output exhibits a substantially rectangular output characteristic down to 0 V (no hiccup mode / latch off). The current limitation of the standby output is independent of the DC input voltage.

Running in current limitation causes the output voltage to fall, this will trigger under voltage protection and disables the main output.

R _{pull up}	Internal Pull up Resistor to internal 3.3 V			1		kΩ
loL	Maximum Sink Current	<i>Vo</i> < 0.4 V			4	mA

10.2 SENSE INPUTS

The main output has sense lines implemented to compensate for voltage drop on load wires in both positive and negative path. The maximum allowed voltage drop is 200 mV on the positive rail and 100 mV on the GND rail.

With open sense inputs the main output voltage will rise by 250 mV. Therefore, if not used, these inputs should be connected to the power output and GND at the power supply connector. The sense inputs are protected against short circuit. In this case the power supply will shut down.

10.3 CURRENT SHARE

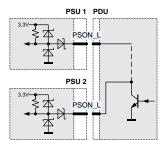

The PET front-ends have an active current share scheme implemented for V1. All the ISHARE current share pins need to be interconnected in order to activate the sharing function. If a supply has an internal fault or is not turned on, it will disconnect its ISHARE pin from the share bus. This will prevent dragging the output down (or up) in such cases.

The current share function uses an analog bus to transmit and receive current share information. The controller implements a Master/Slave current share function. The power supply providing the largest current among the group is automatically the Master. The other supplies will operate as Slaves and increase their output current to a value close to the Master by slightly increasing their output voltage. The voltage increase is limited to +250 mV.

The standby output uses a passive current share method (droop output voltage characteristic).

10.4 PSON L INPUT

The PSON_L is an internally pulled-up (3.3 V) input signal to enable/disable the main output V1 of the front-end. With low level input the main output is enabled. This active-low pin is also used to clear any latched fault condition. The PSON_L can be either controlled by an open collector device or by a voltage source.

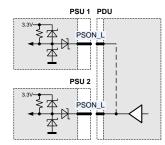

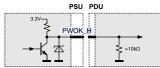

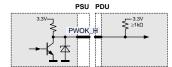

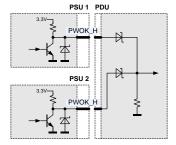

Figure 6. PSON_L connection

10.5 PWOK HOUTPUT

The PWOK_H is an open drain output with an internal pull-up to 3.3 V indicating whether both VSB and V1 outputs are within regulation. This pin is active-High.

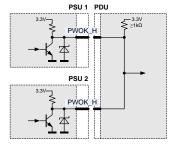

Figure 7. PWOK_H connection

Asia-Pacific

Europe, Middle East

North America

+86 755 298 85888

+353 61 225 977

10.6 PRESENT_L OUTPUT

The PRESENT_L pin is wired through a 100 Ohms resistor to internal GND within the power supply. This pin does indicate that there is a power supply present in this system slot. An external pull-up resistor has to be added within the application. Current into PRESENT_L should not exceed 5mA to guarantee a low level voltage if power supply is seated.

10.8 LED INDICATOR

The front-end has one front LED showing the status of the supply. The LED is bi-colored: green and amber and indicates DC input and DC output power presence and warning or fault conditions. *Table 1* below lists the different LED status.

OPERATING CONDITION ⁴	LED SIGNALING
No Vi or DC Line in UV condition, V_{SB} not present from paralleled power supplies	Off
PSON_L High	Blinking Green 1 Hz
No Vi or DC Line in UV condition, VsB present from paralleled power supplies	
V_1 or V_{SB} out of regulation	
Over temperature shutdown	Solid Amber
Output over voltage shutdown (V_1 or V_{SB})	Solid Affice
Output over current shutdown (V_1 or V_{SB})	
Fan error (>55%)	
Over temperature warning	Blinking Amber 1 Hz
Minor fan regulation error (>45%, <45%)	Billiking Amber 1 112
Firmware boot loading in process	Blinking Green 2 Hz
Outputs V_1 and V_{SB} in regulation	Solid Green

 $^{^{\}rm 3}$ At repeated ON-OFF cycles the start-up times can be increased by 1 s

11. I2C / POWER MANAGEMENT BUS COMMUNICATION

The PET front-end is a communication Slave device only; it never initiates messages on the I²C/SMBus by itself. The communication bus voltage and timing is defined in *Table 2* and further characterized through:

- The SDA/SCL IOs use 3.3 V logic levels
- External pull-up resistors on SDA/SCL required for correct signal edges
- Full SMBus clock speed of 100 kbps
- Clock stretching limited to 1 ms
- SCL low time-out of >25 ms with recovery within 10 ms
- Recognizes any time Start/Stop bus conditions

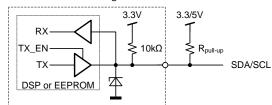

Figure 13. Physical Layer of Communication Interface

Communication to the DSP or the EEPROM will be possible as long as the input DC voltage is provided. If no DC is present, communication to the unit is possible as long as it is connected to a life VSB output (provided e.g. by the redundant unit). If only V1 is provided, communication is not possible.

 $^{^{1}}$ Cb = Capacitance of bus line in pF, typically in the range of 10...400 pF

Table 2. PC / SMBus Specification

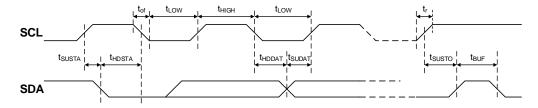

Figure 14. PC / SMBus Timing

ADDRESS SELECTION

The address for I²C communication can be configured by pulling address input pins A1 and A0 either to GND (Logic Low) or leave them open (Logic High). An internal pull up resistor will cause the A0 / A1 and A2 pin to be in High Level if left open. A fixed addressing offset exists between the Controller and the EEPROM.

A2 ²⁾	A1	Α0	I2C Ad	ldress 1)
AZ '	AI	AU	Controller	EEPROM
0	0	0	0xB0	0xA0
0	0	1	0xB2	0xA2
0	1	0	0xB4	0xA4
0	1	1	0xB6	0xA6
1	0	0	0xB8	0xA8
1	0	1	0xBA	0xAA
1	1	0	0xBC	0xAC
1	1	1	0xBE	0xAE

 $^{^{1)}\,\}mbox{The LSB}$ of the address byte is the R/W bit.

Table 3. Address and Protocol Encoding

11.1 SMBALERT_L OUTPUT

The SMBALERT_L signal indicates that the power supply is experiencing a problem that the system agent should investigate. This is a logical OR of the Shutdown and Warning events. It is asserted (pulled Low) at Shutdown or Warning events such as reaching temperature warning/shutdown threshold of critical component, general failure, over-current, over-voltage, under-voltage or low-speed of failed fan. This signal may also indicate the power supply is operating in an environment exceeding the specified limits.

The SMBAlert signal is asserted simultaneously with the LED turning to solid amber or blinking amber.

PARAMETER		DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
SMB_AL	.ERT_L					
Vext	Maximum External Pull up Voltage				12	V
I_{OH}	Maximum High Level Leakage Current	No Failure or Warning condition, $V_O = 12 \text{ V}$			10	μΑ
V_{OL}	Output Low Level Voltage	Failure or Warning condition, I_{sink} < 4 mA	0		0.4	V
R _{pull up}	Internal Pull up Resistor to internal 3.3 V			None		
IOL	Maximum Sink Current	<i>V_O</i> < 0.4 V			4	mA

²⁾ A2 is used on the standard model only.

On special models (e.g. PET1600-12-074ND020) the connector PIN is used for IN_OK functionality. These models have only two addressing pins A0 and A1. A2 is set to 0 inside firmware by default.

11.2 CONTROLLER AND EEPROM ACCESS

The controller and the EEPROM in the power supply share the same I²C bus physical layer (see *Figure 16*) and can be accessed under different addresses, see ADDRESS SELECTION. The SDA/SCL lines are connected directly to the controller and EEPROM which are supplied by internal 3.3 V.

The EEPROM provides 256 bytes of user memory. None of the bytes are used for the operation of the power supply.

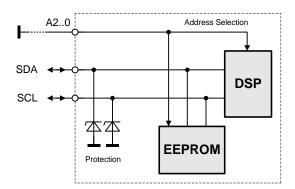

Figure 16. PC Bus to DSP and EEPROM

11.3 EEPROM PROTOCOL

The EEPROM follows the industry communication protocols used for this type of device. Even though page write / read commands are defined, it is recommended to use the single byte write / read commands.

WRITE

The write command follows the "SMBus 1.1 Write Byte Protocol". After the device address with the write bit cleared, the Two Byte Data Address is sent followed by the data byte and the STOP condition. A new START condition on the bus should only occur after 5ms of the last STOP condition to allow the EEPROM to write the data into its memory.

READ

The read command follows the "SMBus 1.1 Read Byte Protocol". After the device address with the write bit cleared the two byte data address is sent followed by a repeated start, the device address and the read bit set. The EEPROM will respond with the data byte at the specified location.

11.4 POWER MANAGEMENT BUS PROTOCOL

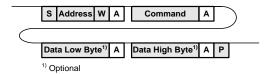

The Power Management Bus is an open standard protocol that defines means of communicating with power conversion and other devices. For more information, please see the System Management Interface Forum web site at: www.powerSIG.org.

Power Management Bus command codes are not register addresses. They describe a specific command to be executed. The PET1600-12-074ND supply supports the following basic command structures:

- · Clock stretching limited to 1 ms
- SCL low time-out of >25 ms with recovery within 10 ms
- · Recognized any time Start/Stop bus conditions

WRITE

The write protocol is the SMBus 1.1 Write Byte/Word protocol. Note that the write protocol may end after the command byte or after the first data byte (Byte command) or then after sending 2 data bytes (Word command).

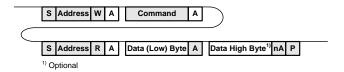

In addition, Block write commands are supported with a total maximum length of 255 bytes. See PET1600-12-074NA / PET1600-12-074ND Power Management Bus Communication Manual URP.00234 for further information.

READ

The read protocol is the SMBus 1.1 Read Byte/Word protocol. Note that the read protocol may request a single byte or word.

In addition, Block read commands are supported with a total maximum length of 255 bytes. See PET1600-12-074NA/ PET1600-12-074ND Power Management Bus Communication Manual URP.00234 for further information.

11.5 GRAPHICAL USER INTERFACE

The Bel Power Solutions provides with its "I²C Utility" a Windows® XP/Vista/Win7 compatible graphical user interface allowing the programming and monitoring of the PET1600-12-074xD Front-End. The utility can be downloaded on:

belfuse.com/power-solutions and supports both the PSMI and Power Management Bus protocols.

The GUI allows automatic discovery of the units connected to the communication bus and will show them in the navigation tree. In the monitoring view the power supply can be controlled and monitored.

If the GUI is used in conjunction with the YTM.00045 Evaluation Board it is also possible to control the PSON_L pin(s) of the power supply.

The monitoring screen also allows to enable the hot-standby mode on the power supply. The mode status is monitored and by changing the load current it can be monitored when the power supply is being disabled for further energy savings. This obviously requires 2 power supplies being operated as a redundant system (as in the evaluation kit).

NOTE: The user of the GUI needs to ensure that only one of the power supplies have the hot-standby mode enabled.

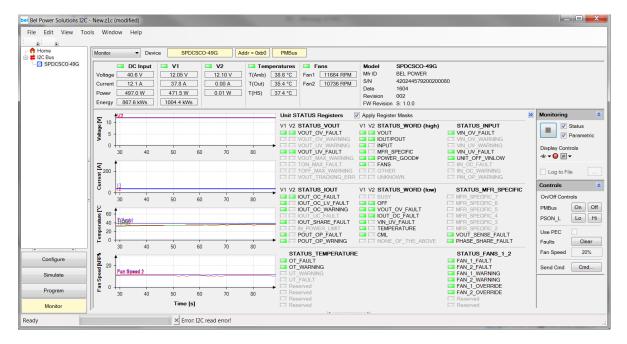

Figure 17. Monitoring dialog of the PC Utility

12. TEMPERATURE AND FAN CONTROL

To achieve best cooling results sufficient airflow through the supply must be ensured. Do not block or obstruct the airflow at the rear of the supply by placing large objects directly at the output connector. The PET1600-12-074ND is provided with a rear to front airflow, which means the air enters through the DC-output of the supply and leaves at the DC-inlet. The PET1600-12-074RD is provided with a front to rear airflow, which means the air enters through the DC-input of the supply and leaves at the DC-output. The PET1600-12-074xD power supply has been designed for horizontal operation.

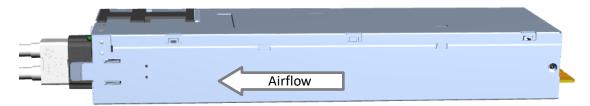

Figure 18. Airflow direction PET1600-12-074ND

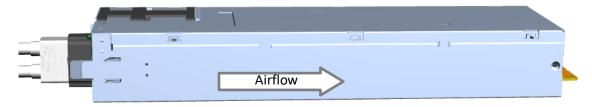

Figure 19. Airflow direction PET1600-12-074RD

The fan inside of the supply is controlled by a microprocessor. The rpm of the fan is adjusted to ensure optimal supply cooling and is a function of output power and the inlet temperature. *Figure 20* illustrates the programmed fan curves.

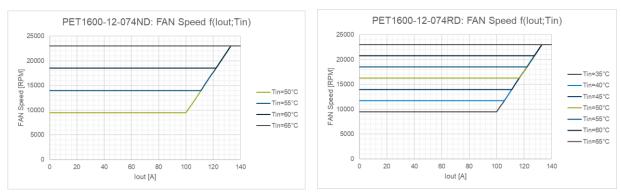

Figure 20. Fan speed vs. main output load

The PET1600-12-074ND provides access via I^2C to the measured temperatures of sensors within the power supply, see *Table 4*. The microprocessor is monitoring these temperatures and if warning threshold of one of these sensors is reached it will set fan to maximum speed. If temperatures continue to rise above shut down threshold the main output V_7 (or V_{SB} if auxiliary converter is affected) will be disabled. At the same time, the warning or fault condition is signalized accordingly through LED, PWOK_H and SMBALERT_L.

TEMPERATURE SENSOR	DESCRIPTION / CONDITION	POWER MANAGEMENT BUS REGISTER	WARNING THRESHOLD	SHUT DOWN THRESHOLD
Inlet Air Temperature	PET1600-12-074ND Sensor located on control board close to DC end of power supply (card edge connector)	0x8D	77°C	80°C
	PET1600-12-074RD Sensor located next to the fan of power supply		67°C	67°C
Synchronous Rectifier	Sensor located on secondary side of DC/DC stage	0x8F	95°C	110°C

13. MAXIMUM OUTPUT POWER VERSUS INLET TEMPERATURE FOR SAFETY COMPLIANCY

For safety compliant operation the power supply needs to be operating inside the specified operating conditions. The PET1600-12-074xD modules have different power derating behavior which are mainly dependent on the air flow direction and the ambient conditions.

PET1600-12-074ND

Between 0°C and 55°C power supply is only depending on DC input altitude. Above 55°C the maximum output power is further reduced with rising temperature

Figure 21 illustrates these maximum current and power levels.

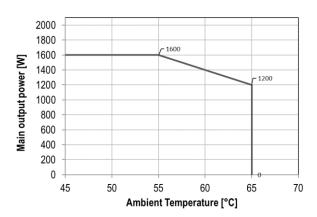

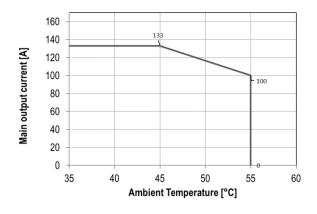

Figure 21. Maximum current and power levels PET1600-12-074ND

PET1600-12-074RD

Between 0° C and 45° C power supply is only depending on DC input altitude. Above 40° C the maximum output power is further reduced with rising temperature.

Figure 22 illustrates these maximum current and power levels.

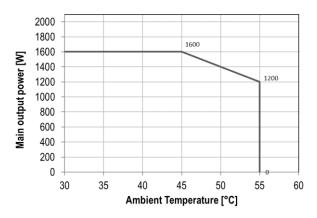

Figure 22. Maximum current and power levels PET1600-12-074RD
