TRAVEO™ T2G 32-bit Automotive MCU

Based on Arm® Cortex®-M4F-single

General description

CYT2BL is a family of TRAVEO™ T2G microcontrollers targeted at automotive systems such as body control units. CYT2BL has an Arm® Cortex®-M4 CPU for primary processing, and an Arm® Cortex®-M0+ CPU for peripheral and security processing. These devices contain embedded peripherals supporting Controller Area Network with Flexible Data rate (CAN FD), Local Interconnect Network (LIN), and Clock Extension Peripheral Interface (CXPI). TRAVEO™ T2G devices are manufactured on an advanced 40-nm process. CYT2BL incorporates a low-power flash memory, multiple high-performance analog and digital peripherals, and enables the creation of a secure computing platform.

Features

- **Dual CPU subsystem**
  - 160-MHz (max) 32-bit Arm® Cortex®-M4F CPU with
    - Single-cycle multiply
    - Single-precision floating point unit (FPU)
    - Memory protection unit (MPU)
  - 100-MHz (max) 32-bit Arm® Cortex® M0+ CPU with
    - Single-cycle multiply
    - Memory protection unit
  - Inter-processor communication in hardware
  - Three DMA controllers
    - Peripheral DMA controller #0 (P-DMA0) with 92 channels
    - Peripheral DMA controller #1 (P-DMA1) with 44 channels
    - Memory DMA controller #0 (M-DMA0) with 4 channels
- **Integrated memories**
  - 4160 KB of code-flash with an additional 128 KB of work-flash
    - Read-While-Write (RWW) allows updating the code-flash/work-flash while executing code from it
    - Single- and dual-bank modes (specifically for Firmware update Over The Air [FOTA])
    - Flash programming through SWD/JTAG interface
  - 512 KB of SRAM with selectable retention granularity
- **Crypto engine**[1]
  - Supports enhanced Secure Hardware Extension (eSHE) and Hardware Security Module (HSM)
  - Secure boot and authentication
    - Using digital signature verification
    - Using fast secure boot
  - AES: 128-bit blocks, 128-/192-/256-bit keys
  - 3DES[2]: 64-bit blocks, 64-bit key
  - Vector unit[2] supporting asymmetric key cryptography such as Rivest-Shamir-Adleman (RSA) and Elliptic Curve (ECC)
  - SHA-1/2/3[2]: SHA-512, SHA-256, SHA-160 with variable length input data
  - CRC[2]: supports CCITT CRC16 and IEEE-802.3 CRC32
  - True random number generator (TRNG) and pseudo random number generator (PRNG)
  - Galois/Counter Mode (GCM)

Notes
1. Crypto engine features are available on select MPNs.
2. This feature is not available in “eSHE only” parts. For more information, see **Ordering information**.

Features

- **Functional safety for ASIL-B**
  - Memory protection unit (MPU)
  - Shared memory protection unit (SMPU)
  - Peripheral protection unit (PPU)
  - Watchdog timer (WDT)
  - Multi-counter watchdog timer (MCWDT)
  - Low-voltage detector (LVD)
  - Brown-out detector (BOD)
  - Overvoltage detection (OVD)
  - Clock supervisor (CSV)
  - Hardware error correction (SECDED ECC) on all safety-critical memories (SRAM, flash)
- **Low-power 2.7-V to 5.5-V operation**
  - Low-power Active, Sleep, Low-power Sleep, DeepSleep, and Hibernate modes for fine-grained power management
  - Configurable options for robust BOD
    - Two threshold levels (2.7 V and 3.0 V) for BOD on V_{DDD} and V_{DDA}
    - One threshold level (1.1 V) for BOD on V_{CCD}
- **Wakeup support**
  - Up to two pins to wakeup from Hibernate mode
  - Up to 152 GPIO pins to wakeup from Sleep modes
  - Event Generator, SCB, Watchdog Timer, RTC alarms to wake from DeepSleep modes
- **Clock sources**
  - Internal main oscillator (IMO)
  - Internal low-speed oscillator (ILO)
  - External crystal oscillator (ECO)
  - Watch crystal oscillator (WCO)
  - Phase-locked loop (PLL)
  - Frequency-locked loop (FLL)
- **Communication interfaces**
  - Up to eight CAN FD channels
    - Increased data rate (up to 8 Mbps) compared to classic CAN, limited by physical layer topology and transceivers
    - Compliant to ISO 11898-1:2015
    - Supports all the requirements of Bosch CAN FD Specification V1.0 for non-ISO CAN FD
    - ISO 16845:2015 certificate available
  - Up to eight runtime-reconfigurable SCB (serial communication block) channels, each configurable as I^2C, SPI, or UART
  - Up to 12 independent LIN channels
    - LIN protocol compliant with ISO 17987
  - Up to four CXPI channels with data rate up to 20 kbps
- **Timers**
  - Up to 75 16-bit and eight 32-bit timer/counter pulse-width modulator (TCPWM) blocks
    - Up to 12 16-bit counters for motor control
    - Up to 63 16-bit counters and eight 32-bit counters for regular operations
    - Supports timer, capture, quadrature decoding, pulse-width modulation (PWM), PWM with dead time (PWM_DT), pseudo-random PWM (PWM_PR), and shift-register (SR) modes
  - Up to 11 Event Generation (EVTGEN) timers supporting cyclic wakeup from DeepSleep
    - Events trigger a specific device operation (such as execution of an interrupt handler, a SAR ADC conversion, and so on)

Features

- **Real time clock (RTC)**
  - Year/month/date, day-of-week, Hour:Minute:Second fields
  - Supports both 12- and 24-hour formats
  - Automatic leap-year correction
- **I/O**
  - Up to 152 programmable I/Os
  - Two I/O types
    - GPIO Standard (GPIO_STD)
    - GPIO Enhanced (GPIO_ENH)
- **Regulators**
  - Generates 1.1-V nominal core supply from a 2.7-V to 5.5-V input supply
  - Two types of regulators
    - DeepSleep
    - Core internal
- **Programmable analog**
  - Three SAR A/D converters with up to 67 external channels (64 I/Os + 3 I/Os for motor control)
    - ADC0 supports 24 logical channels, with 24 + 1 physical connections
    - ADC1 supports 32 logical channels, with 32 + 1 physical connections
    - ADC2 supports 8 logical channels, with 8 + 1 physical connections
    - Any external channel can be connected to any logical channel in the respective SAR
  - Each ADC supports 12-bit resolution and sampling rates of up to 1 Msps
  - Each ADC also supports up to six internal analog inputs such as:
    - Bandgap reference to establish absolute voltage levels
    - Calibrated diode for junction temperature calculations
    - Two AMUXBUS inputs and two direct connections to monitor supply levels
  - Each ADC supports addressing of external multiplexers
  - Each ADC has a sequencer supporting autonomous scanning of configured channels
  - Synchronized sampling of all ADCs for motor-sense applications
- **Smart I/O**
  - Up to five Smart I/O blocks, which can perform Boolean operations on signals going to and from I/Os
  - Up to 36 I/Os (GPIO_STD) supported
- **Debug interface**
  - JTAG controller and interface compliant to IEEE-1149.1-2001
  - Arm® serial wire debug (SWD) port
  - Supports Arm® Embedded Trace Macrocell (ETM) Trace
    - Data trace using SWD
    - Instruction and data trace using JTAG
- **Compatible with industry-standard tools**
  - GHS/MULTI or IAR EWARM for code development and debugging
- **Packages**
  - 64-LQFP, 10 × 10 × 1.7 mm (max), 0.5-mm lead pitch
  - 80-LQFP, 12 × 12 × 1.7 mm (max). 0.5-mm lead pitch
  - 100-LQFP, 14 × 14 × 1.7 mm (max), 0.5-mm lead pitch
  - 144-LQFP, 20 × 20 × 1.7 mm (max), 0.5-mm lead pitch
  - 176-LQFP, 24 × 24 × 1.7 mm (max), 0.5-mm lead pitch

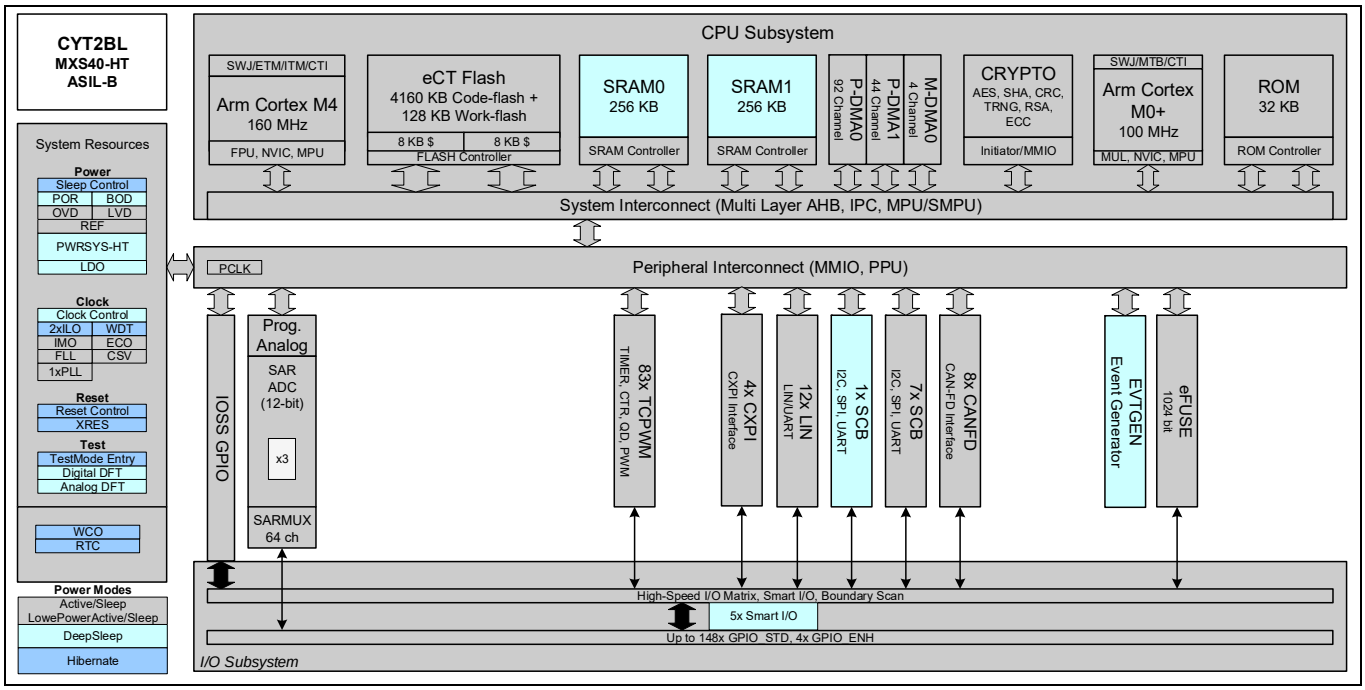
2 Blocks and functionality

2.1 Block diagram



The **Block diagram** shows the CYT2BL architecture, giving a simplified view of the interconnection between subsystems and blocks. CYT2BL has four major subsystems: CPU, system resources, peripherals, and I/O[4, 5]. The color-coding shows the lowest power mode where the particular block is still functional.

CYT2BL provides extensive support for programming, testing, debugging, and tracing of both hardware and firmware.

Debug-on-chip functionality enables in-system debugging using the production device. It does not require special interfaces, debugging pods, simulators, or emulators.

The JTAG interface is fully compatible with industry-standard third-party probes such as I-jet, J-Link, and GHS.

The debug circuits are enabled by default.

CYT2BL provides a high level of security with robust flash protection and the ability to disable features such as debug.

Additionally, each device interface can be permanently disabled for applications concerned with phishing attacks from a maliciously reprogrammed device or attempts to defeat security by starting and interrupting flash programming sequences. All programming, debug, and test interfaces are disabled when maximum device security is enabled.

Notes
4. GPIO_STD supporting 2.7 V to 5.5 V V_{DDIO} range.
5. GPIO_ENH supporting 2.7 V to 5.5 V V_{DDIO} range with higher currents at lower voltages.

3 Functional description

3.1 CPU subsystem

3.1.1 CPU

The CYT2BL CPU subsystem contains a 32-bit Arm® Cortex®-M0+ CPU with MPU, a 32-bit Arm® Cortex®-M4F CPU with MPU, and single-precision FPU. This subsystem also includes P-/M-DMA controllers, a cryptographic accelerator, 4160 KB of code-flash, 128 KB of work-flash, 512 KB of SRAM, and 32 KB of ROM.

The Cortex®-M0+ CPU provides a secure, un-interruptible boot function. This guarantees that, following completion of the boot function, system integrity is valid and privileges are enforced. Shared resources (flash, SRAM, peripherals, and so on) can be accessed through bus arbitration, and exclusive accesses are supported by an inter-processor communication (IPC) mechanism using hardware semaphores.

3.1.2 DMA controllers

CYT2BL has three DMA controllers: P-DMA0 with 16 general-purpose and 76 dedicated channels, P-DMA1 with 8 general-purpose and 36 dedicated channels, and M-DMA0 with four channels. P-DMA is used for peripheral-to-memory and memory-to-peripheral data transfers and provides low latency for a large number of channels. Each P-DMA controller uses a single data-transfer engine that is shared by the associated channels. General-purpose channels have a rich interconnect matrix including P-DMA cross triggering, which enables demanding data-transfer scenarios. Dedicated channels have a single triggering input (such as an ADC channel) to handle common transfer needs. M-DMA is used for memory-to-memory data transfers and provides high memory bandwidth for a small number of channels. M-DMA uses a dedicated data-transfer engine for each channel. They support independent accesses to peripherals using the AHB multi-layer bus.

3.1.3 Flash

CYT2BL has 4160 KB (4032 KB with a 32-KB sector size, and 128 KB with an 8-KB sector size) of code-flash with an additional work-flash of up to 128 KB (96 KB with 2-KB sector size, and 32 KB with 128-B sectors size). Work-flash is optimized for reprogramming many more times than code-flash. Code-flash supports Read-While-Write (RWW) operation allowing flash to be updated while the CPU is active. Both the code-flash and work-flash areas support dual-bank operation for over-the-air (OTA) programming.

3.1.4 SRAM

CYT2BL has 512 KB of SRAM with two independent controllers. The first controller, SRAM0, provides DeepSleep retention in 32-KB increments while SRAM1 is selectable between fully retained and not retained.

3.1.5 ROM

CYT2BL has 32-KB ROM that contains boot and configuration routines. This ROM enables secure boot and authentication of user flash to guarantee a secure system.

3.1.6 Cryptography accelerator for security

The cryptography accelerator implements the (3)DES block cipher, AES block cipher, SHA hash, cyclic redundancy check, pseudo random number generation, true random number generation, galois/counter mode, and a vector unit to support asymmetric key cryptography such as RSA and ECC.

Depending on the part number, this block is either completely or partially available or not available at all. See **Ordering information** for more details.

3.2 System resources

3.2.1 Power system

The power system ensures that the supply voltage levels meet the requirements of each power mode, and provides a full-system reset when these levels are not valid. Internal power-on reset (POR) guarantees full-chip reset during the initial power ramp.

Three Brown-out detection (BOD) circuits monitor the external supply voltages (V_{DDD}, V_{DDA}, V_{CCD}). The BOD on V_{DDD} and V_{CCD} are initially enabled and cannot be disabled. The BOD on V_{DDA} is initially disabled and can be enabled by the user. For the external supplies V_{DDD} and V_{DDA}, BOD circuits are software configurable with two settings; a 2.7-V minimum voltage that is robust for all internal signaling, and a 3.0-V minimum voltage, which is also robust for all I/O specifications (which are guaranteed at 2.7 V). The BOD on V_{CCD} is provided as a safety measure and is not a robust detector.

Three overvoltage detection (OVD) circuits are provided for monitoring external supplies (V_{DDD}, V_{DDA}, V_{CCD}), and overcurrent detection (OCD) circuits for monitoring internal and external regulators. OVD thresholds on V_{DDD} and V_{DDA} are configurable with two settings; a 5.0-V and 5.5-V maximum voltage.

Two voltage detection circuits are provided to monitor the external supply voltage (V_{DDD}) for falling and rising levels, each configurable for one of the 26 selectable levels.

All BOD, OVD, and OCD circuits on V_{DDD} and V_{CCD} generate a reset, because these protect the CPUs and fault logic. The BOD and OVD circuits on V_{DDA} can be configured to generate either a reset, or a fault.

3.2.2 Regulators

CYT2BL contains two regulators that provide power to the low-voltage core transistors: DeepSleep and core internal. These regulators accept a 2.7–5.5-V V_{DDD} supply and provide a low-noise 1.1-V supply to various parts of the device. These regulators are automatically enabled and disabled by hardware and firmware when switching between power modes. The core internal regulators operate in active mode, and provide power to the CPU subsystem and associated peripherals.

3.2.2.1 DeepSleep

The DeepSleep regulator is used to maintain power to a small number of blocks when in DeepSleep mode. These blocks include the ILO and WDT timers, BOD detector, SCB0, SRAM memories, Smart I/O, and other configuration memories. The DeepSleep regulator is enabled when in DeepSleep mode, and the core internal regulator is disabled. It is disabled when XRES_L is asserted (LOW) and when the core internal regulator is disabled.

3.2.2.2 Core internal

The core internal regulator supports load currents up to 150 mA, and is operational during device startup (boot process), and in Active/Sleep modes.

3.2.3 Clock system

The CYT2BL clock system provides clocks to all subsystems that require them, and glitch-free switching between different clock sources. In addition, the clock system ensures that no metastable conditions occur.

The clock system for CYT2BL consists of the 8-MHz IMO, two ILOs, three watchdog timers, a PLL, an FLL, five clock supervisors (CSV), a 3.988- to 33.34-MHz ECO, and a 32.768-kHz WCO.

The clock system supports two main clock domains: CLK_HF and CLK_LF.

- CLK_HFx are the active domain clocks. Each can use any of the high-frequency clock sources including IMO, EXT_CLK, ECO, FLL, or PLL.
- CLK_LF is a DeepSleep domain clock and provides source for MCWDT or RTC modules. The reference clock for the CLK_LF domain is selectable from ILO0, ILO1, WCO, or disabled.

Table 3-1 CLK_HF destinations

Name	Description
CLK_HF0	CPUSS clocks, PERI, and AHB infrastructure
CLK_HF1	Event Generator, also available in HSIOM as an output

3.2.3.1 IMO clock source

The IMO is the frequency reference in CYT2BL when no external reference is available or enabled. The IMO operates at a frequency of around 8 MHz.

3.2.3.2 ILO clock source

An ILO is a low-power oscillator, nominally 32.768 kHz, which generates clocks for a watchdog timer when in DeepSleep mode. There are two ILOs to ensure clock supervisor (CSV) capability in DeepSleep mode. ILO-driven counters can be calibrated to the IMO, WCO, or ECO to improve their accuracy. ILO1 is also used for clock supervision.

3.2.3.3 PLL and FLL

A PLL or FLL may be used to generate high-speed clocks from the IMO, the ECO, or EXT_CLK. The FLL provides a much faster lock than the PLL (5 µs instead of 35 µs) in exchange for a small amount (±2%) of frequency error[6].

3.2.3.4 Clock supervisor

Each CSV allows one clock (reference) to supervise the behavior of another clock (monitored). Each CSV has counters for both the monitored and reference clocks. Parameters for each counter determine the frequency of the reference clock as well as the upper and lower frequency limits of the monitored clock. If the frequency range comparator detects a stopped clock or a clock outside the specified frequency range, an abnormal state is signaled and either a reset or an interrupt is generated.

3.2.3.5 EXT_CLK

One of two GPIO_STD I/Os can be used to provide an external clock input of up to 80 MHz. This clock can be used as the source clock for either the PLL or FLL, or can be used directly by the CLK_HF domain.

3.2.3.6 ECO

The ECO provides high-frequency clocking using an external crystal connected to the ECO_IN and ECO_OUT pins. It supports fundamental mode (non-overtone) quartz crystals, in the range of 3.988 to 33.34 MHz. When used in conjunction with the PLL, it generates CPU and peripheral clocks up to device's maximum frequency. ECO accuracy depends on the selected crystal. If the ECO is disabled, the associated pins can be used for any of the available I/O functions.

3.2.3.7 WCO

The WCO is a low-power, watch-crystal oscillator intended for real-time-clock applications. It requires an external 32.768-kHz crystal connected to the WCO_IN and WCO_OUT pins. The WCO can also be configured as a clock reference for CLK_LF, which is the clock source for the MCWDT and RTC.

3.2.4 Reset

CYT2BL can be reset from a variety of sources, including software. Reset events are asynchronous and guarantee reversion to a known state. The reset cause (POR, BOD, OVD, overcurrent, XRES_L, WDT, MCWDT, software reset, fault, CSV, Hibernate wakeup, debug) is recorded in a register, which is sticky through reset and allows software to determine the cause of the reset. An XRES_L pin is available for external reset.

Note
6. Operation of reference-timed peripherals (like a UART) with an FLL-based reference is not recommended due the allowed frequency error.

3.2.5 Watchdog timers

CYT2BL has one watchdog timer (WDT) and two multi-counter watchdog timers (MCWDT).

The WDT is a free-running counter clocked only by ILO0, which allows it to be used as a wakeup source from Hibernate. This allows watchdog operation during all power modes and needs to be serviced during a configured window, otherwise generates a watchdog reset, if not serviced before the timeout occurs. A watchdog reset is recorded in the Reset Cause register.

An MCWDT is available for each of the CPU cores. These timers provide more capabilities than the WDT, and are only available in the Active, Sleep, and DeepSleep modes. These timers have multiple counters that can be used separately or cascaded to trigger interrupts and/or resets. They are clocked from ILO0 or the WCO.

3.2.6 Power modes

CYT2BL has six different power modes:

- Active – All peripherals are available
- Low-Power Active (LPACTIVE) – Low-power profile of Active mode where all peripherals and the CPUs are available, but with limited capability
- Sleep – All peripherals except the CPUs are available
- Low-Power Sleep (LPSLEEP) – Low-power profile of Sleep mode where all peripherals except the CPUs are available, but with limited capability
- DeepSleep – Only peripherals which work with CLK_LF are available
- Hibernate – the device and I/O states are frozen, the device resets on wakeup

3.3 Peripherals

3.3.1 Peripheral clock dividers

Integer and fractional clock dividers are provided for peripheral and timing purposes.

Table 3-2 Clock dividers

Divider	Count	Description
div_8	32	Integer divider, 8 bits
div_16	16	Integer divider, 16 bits
div_24_5	8	Fractional divider, 24.5 bits (24 integer bits, 5 fractional bits)

3.3.2 Peripheral protection unit

The peripheral protection unit (PPU) controls and monitors unauthorized access from all masters (CPU, P-/M-DMA, Crypto, and any enabled debug interface) to the peripherals. It allows or restricts data transfers on the bus infrastructure. The access rules are enforced based on specific properties of a transfer, such as an address range for the transfer and access attributes (such as read/write, user/privilege, and secure/non-secure).

3.3.3 12-bit SAR ADC

CYT2BL contains three 1-Msps SAR ADCs. These ADCs can be clocked at up to 26.67 MHz and provide a 12-bit result in 26 clock cycles.

The references for all three SAR ADCs comes from a dedicated pair of inputs: VREFH and VREFL[7].

CYT2BL devices support up to 85 logical ADC channels, and external inputs from up to 67 I/Os. Each ADC also supports six internal connections for diagnostic and monitoring purposes. The number of ADC channels (per ADC and package type) are listed in **Table 1-1**.

Each ADC has a sequencer, which autonomously cycles through the configured channels (sequencer scan) with zero-switching overhead (that is, the aggregate sampling bandwidth, when clocked at 26.67 MHz, is equal to 1 Msps whether it is for a single channel or distributed over several channels). The sequencer switching is controlled through a state machine or firmware. The sequencer prioritizes trigger requests, enables the appropriate analog channel, controls ADC sampling, initiates ADC data conversion, manages results, and initiates subsequent conversions for repetitive or group conversions without CPU intervention.

Each SAR ADC has an analog multiplexer used to connect the signals to be measured to the ADC. It has 32 GPIO_STD inputs, one special GPIO_STD input for motor-sense, and six additional inputs to measure internal signals such as a band-gap reference, a temperature sensor, and power supplies. The device supports synchronous sampling of one motor-sense channel on each of the three ADCs.

CYT2BL has one temperature sensor that is shared by all three ADCs. The temperature sensor must only be sampled by one ADC at a time. Software post processing is required to convert the temperature sensor reading into kelvin or Celsius values.

To accommodate signals with varying source impedances and frequencies, it is possible to have different sample times programmed for each channel. Each ADC also supports range comparison, which allows fast detection of out-of-range values without having to wait for a sequencer scan to complete and for the CPU firmware to evaluate the measurement for out-of-range values.

The ADCs are not usable in DeepSleep and Hibernate modes as they require a high-speed clock. The ADC input reference voltage VREFH range is 2.7 V to V_{DDA} and VREFL is V_{SSA}.

3.3.4 Timer/counter/PWM (TCPWM) block

The TCPWM block consists of 16-bit (75 channels) and 32-bit (eight channels) counters with user-programmable period. Twelve of the 16-bit counters include extra features to support motor control operations. Each TCPWM counter contains a capture register to record the count at the time of an event, a period register (used to either stop or auto-reload the counter when its count is equal to the period register), and compare registers to generate signals that are used as PWM duty-cycle outputs.

Each counter within the TCPWM block supports several functional modes such as timer, capture, quadrature, PWM, PWM with dead-time insertion (PWM_DT, 8-bit), pseudo-random PWM (PWM_PR), and shift-register.

In motor-control applications, the counter within the TCPWM block supports enhanced quadrature mode with features such as asymmetric PWM generation, dead-time insertion (16-bit), and association of different dead times for PWM output signals.

The TCPWM block also provides true and complement outputs, with programmable offset between them, to allow their use as deadband complementary PWM outputs. The TCPWM block also has a kill input (only for the PWM mode) to force outputs to a predetermined state; for example, this may be used in motor-drive systems when an overcurrent state is detected and the PWMs driving the FETs need to be shut off immediately (no time for software intervention).

Note
7. VREF_L prevents IR drops in the VSSIO and VSSA paths from impacting the measurements. VREF_L, when properly connected, reduces or removes the impact of IR drops in the VSSIO and VSSA paths from measurements.

3.3.5 Serial communication blocks (SCB)

CYT2BL contains eight serial communication blocks, each configurable to support I^2C, UART, or SPI.

- I2C Interface

  An SCB can be configured to implement a full I^2C master (capable of multi-master arbitration) or slave interface. Each SCB configured for I^2C can operate at speeds of up to 1 Mbps (Fast-mode Plus[8]) and has flexible buffering options to reduce the interrupt overhead and latency of the CPU. In addition, each SCB supports FIFO buffering for receive and transmit data, which, by increasing the time for the CPU to read the data, reduces the need for clock stretching. The I^2C interface is compatible with Standard, Fast-mode, and Fast-mode Plus devices as specified in the NXP I^2C-bus specification and user manual (UM10204). The I^2C-bus I/O is implemented with GPIO in open-drain modes[9, 10].

- UART Interface

  When configured as a UART, each SCB provides a full-featured UART with maximum signaling rate determined by the configured peripheral-clock frequency and over-sampling rate. It supports infrared interface (IrDA) and SmartCard (ISO 7816) protocols, which are minor variants of the UART protocol. It also supports the 9-bit multiprocessor mode that allows the addressing of peripherals connected over common Rx and Tx lines. Common UART functions such as parity, number of stop bits, break detect, and frame error are supported. FIFO buffering of transmit and receive data allows greater CPU service latencies to be tolerated.

  The LIN protocol is supported by the UART. LIN is based on a single-master multi-slave topology. There is one master node and multiple slave nodes on the LIN bus. The SCB UART supports only LIN slave functionality. Compared to the dedicated LIN blocks, an SCB/UART used for LIN requires a higher level of software interaction and increased CPU load.

- SPI Interface

  The SPI configuration supports full Motorola SPI, TI Synchronous Serial Protocol (SSP, essentially adds a start pulse that is used to synchronize SPI-based codecs), and National Microwire (a half-duplex form of SPI). The SPI interface can use the FIFO. The SPI interface operates with up to a 12.5-MHz SPI Clock. SCB also supports EZSPI[11] mode.

SCB0 supports the following additional features:

- Operable as a slave in DeepSleep mode
- I^2C slave EZ (EZI2C[12]) mode with up to 256-B data buffer for multi-byte communication without CPU intervention
- I^2C slave externally-clocked operations
- Command/response mode with a 512-B data buffer for multi-byte communication without CPU intervention

3.3.6 CAN FD

CYT2BL supports two CAN FD controller blocks, each supporting four CAN FD channel. All CAN FD controllers are compliant with the ISO 11898-1:2015 standard; an ISO 16845:2015 certificate is available. It also implements the time-triggered CAN (TTCAN) protocol specified in ISO 11898-4 (TTCAN protocol levels 1 and 2) completely in hardware. All functions concerning the handling of messages are implemented by the Rx and Tx handlers. The Rx handler manages message acceptance filtering, transfer of received messages from the CAN core to a message RAM, and provides receive-message status. The Tx handler is responsible for the transfer of transmit messages from the message RAM, to the CAN core, and provides transmit-message status.

Notes
8. I/Os drive level does not support the full bus capacitance in Fast-mode Plus speeds.
9. This is not 100 percent compliant with the I²C-bus specification; I/Os are not high-voltage compliant, do not support the 20-mA sink requirement of Fast-mode Plus, and violate the leakage specification when no power is applied.
10. Only Port 0 with the slow feature enabled meets the minimum fall time requirement.
11. The Easy SPI (EZSPI) protocol is based on the Motorola SPI operating in any mode (0, 1, 2, or 3). It allows communication between master and slave, and reduces the need for CPU intervention.
12. The Easy I^2C (EZI2C) protocol is a unique communication scheme built on top of the I^2C protocol by Cypress. It uses a meta protocol around the standard I^2C protocol to communicate to an I^2C slave using indexed memory transfers. This reduces the need for CPU intervention.

3.3.7 Local interconnect network (LIN)

CYT2BL contains up to 12 LIN channels. Each channel supports transmission/reception of data following the LIN protocol according to ISO standard 17987. Each LIN channel connects to an external transceiver through a 3-pin interface (including an enable function) and supports master and slave functionality. Each channel also supports classic and enhanced checksum, along with break detection during message reception and wake-up signaling. Break detection, sync field, checksum calculations, and error interrupts are handled in hardware.

3.3.8 Clock extension peripheral interface (CXPI)

CYT2BL contains up to four CXPI channels compliant with JASO D015 and ISO standard 20794 including the controller specification.

Each channel supports:

- Master and slave functionality
- Polling and event trigger method for both normal and long frames
- Non-return to zero (NRZ) and PWM signaling modes
- Collision resolution and carries sense multiple access
- Wakeup pulse generation and detection
- CRC8 and CRC16 for both normal and long frames
- Error detection
- Dedicated FIFO (16 B) for transmit and receive

3.3.9 One-time-programmable (OTP) eFuse

CYT2BL devices contain a 1024-bit OTP eFuse memory that can be used to store and access a unique and unalterable identifier or serial number for each device. eFuses are also used to control the device life-cycle (manufacturing, programming, normal operation, end-of-life, and so on) and the security state. Of the 1024 bits, 192 bits are available for user purposes.

3.3.10 Event generator

The event generator supports generation of interrupts and triggers in the Active mode and interrupts in the DeepSleep mode. The event generators are used to trigger a specific device function (execution of an interrupt handler, a SAR ADC conversion, and so on) and to provide a cyclic wakeup mechanism from the DeepSleep mode. They provide CPU-free triggers for device functions, and reduce CPU involvement in triggering device functions, thus reducing overall power consumption and processing overhead.

3.3.11 Trigger multiplexer

CYT2BL supports connecting various peripherals using trigger signals. Triggers are used to inform a peripheral of the occurrence of an event or change of state. These triggers are used to affect or initiate some action in other peripherals. The trigger multiplexer is used to route triggers from a source peripheral to a destination. Triggers provide active logic functionality and are typically supported in the Active mode.

3.4 I/Os

CYT2BL has up to 152 programmable I/Os.

The I/Os are organized as logical entities called ports, which are a maximum of 8 bits wide. During power-on, and reset, the I/Os are forced to the High-Z state. During the Hibernate mode, I/Os are frozen.

Every I/O can generate an interrupt (if enabled) and each port has an interrupt request (IRQ) and interrupt service routine (ISR) associated with it.

The I/O port power source mapping is listed in **Table 3-3**. The associated supply determines the V_{OH}, V_{OL}, V_{IH}, and V_{IL} levels when configured for CMOS and automotive thresholds.

Table 3-3 I/O port power source

Supply	Ports
V_{DDD}	P0, P1, P2, P3, P4, P5, P16, P17, P18, P19, P20, P21, P22, P23
V_{DDIO_1}	P6, P7, P8, P9[13]
V_{DDIO_2}	P10, P11, P12, P13, P14, P15

3.4.1 Port nomenclature

Px.y describes a particular bit “y” available within an I/O port “x.”

For example, P4.2 reads “port 4, bit 2”.

Each I/O implements the following:

- Programmable drive mode
  - High impedance
  - Resistive pull-up
  - Resistive pull-down
  - Open drain with strong pull-down
  - Open drain with strong pull-up
  - Strong pull-up or pull-down
  - Weak pull-up or pull-down

CYT2BL has two types of programmable I/Os: GPIO Standard and GPIO Enhanced.

3.4.2 GPIO standard (GPIO_STD)

Supports standard automotive signaling across the 2.7-V to 5.5-V V_{DDIO} range. GPIO standard I/Os have multiple configurable drive levels, drive modes, and selectable input levels.

3.4.3 GPIO enhanced (GPIO_ENH)

Supports extended functionality automotive signaling across the 2.7-V to 5.5-V V_{DDIO} range with higher currents at lower voltages (full I^2C timing support, slew-rate control).

Both GPIO_STD and GPIO_ENH implement the following:

- Configurable input threshold (CMOS, TTL, or Automotive)
- Hold mode for latching previous state (used for retaining the I/O state in DeepSleep mode)
- Analog input mode (input and output buffers disabled)

3.4.4 Smart I/O

Smart I/O allows Boolean operations on signals going to the I/O from the subsystems of the chip or on signals coming into the chip. CYT2BL has five Smart I/O blocks. Operation can be synchronous or asynchronous and the blocks operate in all device power modes except for the Hibernate mode.

Note
13.The I/Os in VDDIO_1 domain refer to the VDDD domain in 64-LQFP package.

4 CYT2BL address map

The CYT2BL microcontroller supports the memory spaces shown in **Figure 4-1**:

- 4160 KB (4032 KB + 128 KB) of code-flash, used in the single- or dual-bank mode based on the associated bit in the flash control register
  - Single-bank mode - 4160 KB
  - Dual-bank mode - 2080 KB per bank
- 128 KB (96 KB + 32 KB) of work-flash, used in the single- or dual-bank mode based on the associated bit in the flash control register
  - Single-bank mode - 128 KB
  - Dual-bank mode - 64 KB per bank
- 32 KB of secure ROM
- 512 KB of SRAM (First 2 KB is reserved for internal usage)

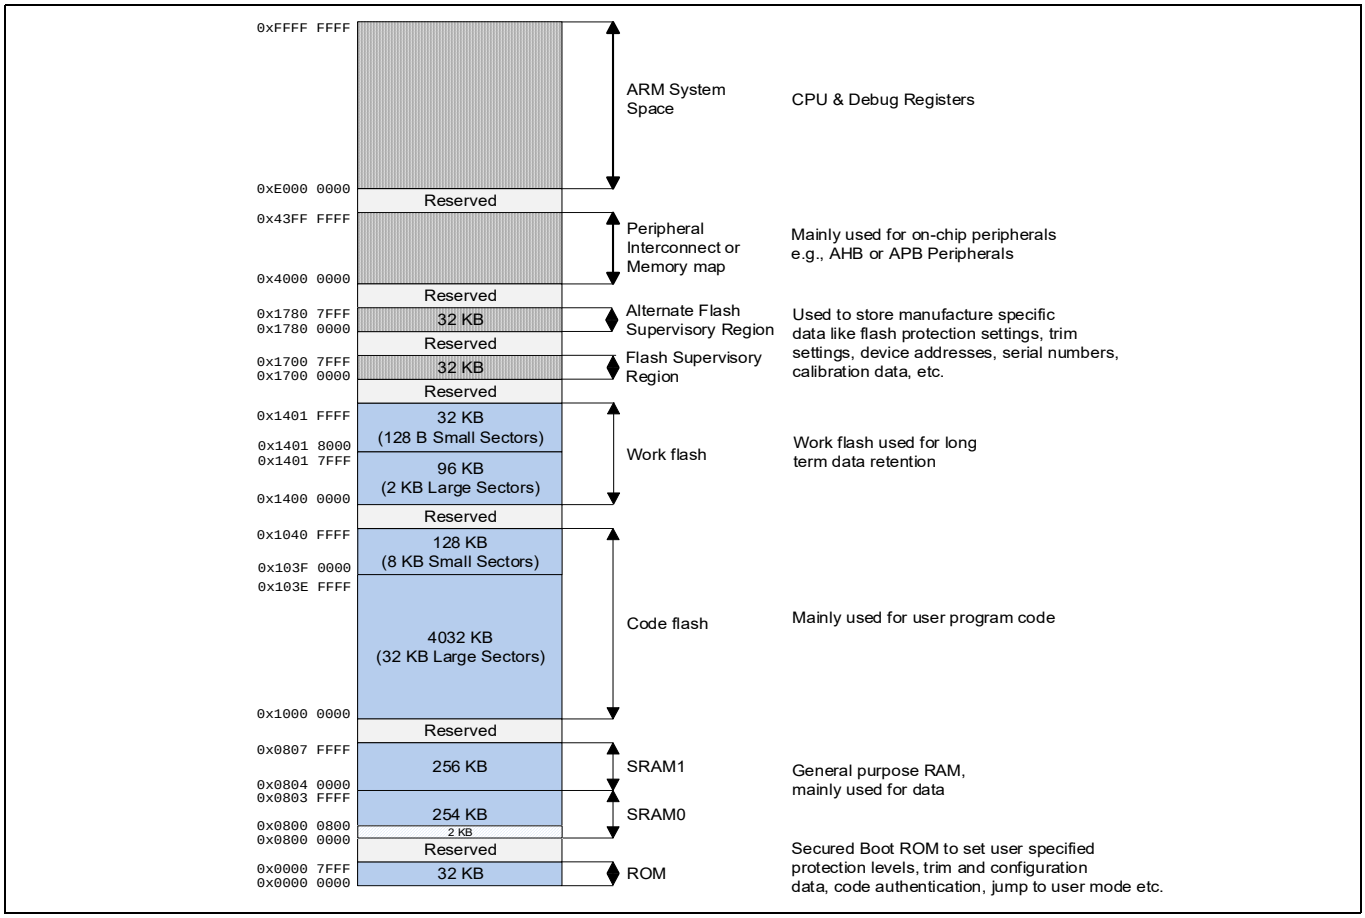


Figure 4-1 CYT2BL address map[14, 15]

Notes
14. The size representation is not up to scale.
15. The first 2KB of SRAM is reserved and not available for users. User must keep the power of the first 32-KB block of SRAM0 in enabled or retained in all Active, LP Active, Sleep, LP Sleep, DeepSleep modes.

8 CYT2BL CPU start-up sequence

The following steps describe the start-up sequence:

1. System Reset (@0x0000 0000)
2. CM0+ executes ROM boot (@0x0000 0004)
   i. Applies trims
   ii. Applies Debug Access port (DAP) access restrictions and system protection from eFuse and supervisory flash
   iii. Authenticates flash boot (only in SECURE life-cycle stage) and transfers control to it
3. CM0+ executes flash boot (from Supervisory flash @0x1700 2000)
   i. Debug pins are configured as per the SWD/JTAG spec[17]
   ii. Sets CM0+ vector offset register (CM0_VTOR part of the Arm® system space) to the beginning of flash (@0x1000 0000)
   iii. CM0+ branches to its Reset handler
4. CM0+ starts execution
   i. Moves CM0+ vector table to SRAM (updates CM0+ vector table base)
   ii. Sets CM4_VECTOR_TABLE_BASE (@0x0000 0200) to the location of CM4 vector table mentioned in flash (specified in CM4 linker definition file)
   iii. Releases CM4 from reset
   iv. Continues execution of CM0+ user application
5. CM4 executes directly from either code-flash or SRAM
   i. CM4 branches to its Reset handler
   ii. Continues execution of CM4 user application

Note
17. Port configuration of SWD/JTAG pins will be changed from the default GPIO mode to support debugging after the boot process, see **Table 11-1** for pin assignments.

11 Package pin list and alternate functions

Most pins have alternate functionality, as specified in **Table 11-1**.

Port 11 has the following additional features:

- Ability to pass full-level analog signals to the SAR without clipping to V_{DDD} in cases where $V_{DDD} < V_{DDA}$
- Ability to simultaneously capture all three ADC signals with highest priority (ADC[0:2]_M)
- Lower noise for the most sensitive sensors

Notes
23.GPIO pins that support an oscillator function (WCO or ECO) must be configured for high-impedance if the oscillator is enabled.
24.This I/O will have increased leakage to ground when VDDD is below the POR threshold.

Notes
26.High-Speed I/O matrix connection (HCon) reference as per **Table 10-1**.
27.Active Mode ordering (ACT#0, ACT#1, and so on) does not have any impact on choosing any alternate functions; HSIOM module will handle the individual alternate function assignment.
28.Refer to **Table 14-1** for more information on pin multiplexer abbreviations used.
29.For any function marked with an identifier (n), the AC timing is only guaranteed within the respective group "n".

10	SCBx_RX	SCB	UART Receive, x-SCB block
11	SCBx_TX	SCB	UART Transmit, x-SCB block
12	SCBx_RTS	SCB	UART Request to Send (Handshake), x-SCB block
13	SCBx_CTS	SCB	UART Clear to Send (Handshake), x-SCB block
14	SCBx_SDA	SCB	I2C Data line, x-SCB block
15	SCBx_SCL	SCB	I2C Clock line, x-SCB block
16	SCBx_MISO	SCB	SPI Master Input Slave Output, x-SCB block
17	SCBx_MOSI	SCB	SPI Master Output Slave Input, x-SCB block
18	SCBx_CLK	SCB	SPI Serial Clock, x-SCB block
19	SCBx_SELy	SCB	SPI Slave Select, x-SCB block, y-select line
20	LINx_RX	LIN	LIN Receive line, x-LIN block
21	LINx_TX	LIN	LIN Transmit line, x-LIN block
22	LINx_EN	LIN	LIN Enable line, x-LIN block
23	CXPI0_RX	CXPI	CXPI Receive line, x-CXPI block
24	CXPI0_TX	CXPI	CXPI Transmit line, x-CXPI block
25	CXPI0_EN	CXPI	CXPI Enable line, x-CXPI block
26	CANx_y_TX	CAN FD	CAN Transmit line, x-CAN block, y-channel number
27	CANx_y_RX	CAN FD	CAN Receive line, x-CAN block, y-channel number
28	CAL_SUP_NZ	CPUSS	ETAS Calibration support line
29	FAULT_OUT_x	SRSS	Fault output line x-0 to 3
30	TRACE_DATA_x	SRSS	Trace data out line x-0 to 3
31	TRACE_CLOCK	SRSS	Trace clock line

Note
30.User interrupt cannot be used for CM0+ application, as it is used internally by system calls. Note, this does not impact CM4 application.

17 Trigger multiplexer

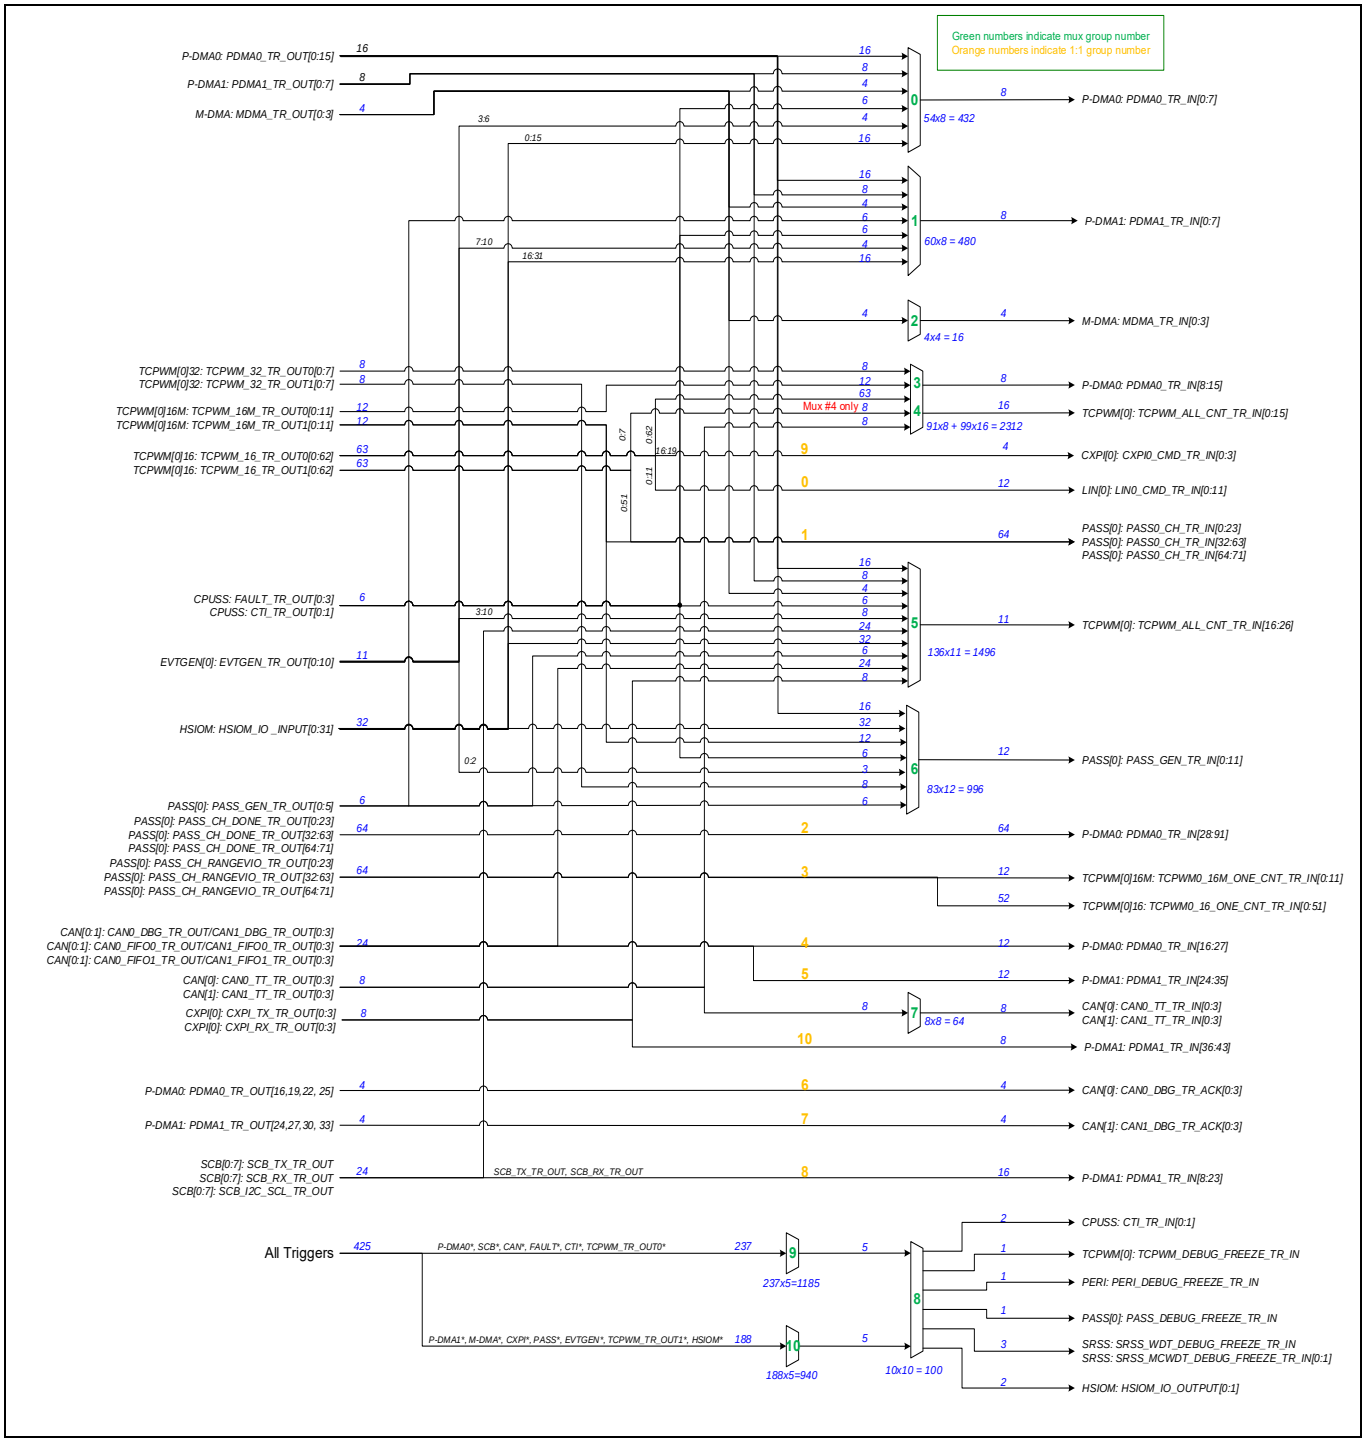

Figure 17-1 Trigger multiplexer[31]

Note
31. The diagram shows only the TRIG_LABEL, final trigger formation based on the formula TRIG_{PREFIX(IN/OUT)}_{MUX_x}_{TRIG_LABEL} / TRIG_{PREFIX(IN_1TO1/OUT_1TO1)}_{x}_{TRIG_LABEL} (see **Table 18-1**, **Table 19-1**, and **Table 20-1**.)

18 Triggers group inputs

Table 18-1 Trigger inputs

Input	Trigger	Description
MUX Group 0: PDMA0_TR (P-DMA0 trigger multiplexer)		
1:16[32]	PDMA0_TR_OUT[0:15]	Allow P-DMA0 to chain to itself, useful for triggering once per row for 2D transfer
17:24	PDMA1_TR_OUT[0:7]	Cross connections from P-DMA1 to P-DMA0, Channels 0-7 are used
25:28	MDMA_TR_OUT[0:3]	Cross connections from M-DMA0 to P-DMA0
29:32	FAULT_TR_OUT[0:3]	Allow faults to initiate data transfer for debug purposes
33:34	CTI_TR_OUT[0:1]	Trace events
35:38	EVTGEN_TR_OUT[3:6]	EVTGEN triggers
39:54	HSIOM_IO_INPUT[0:15]	I/O inputs
MUX Group 1: PDMA1_TR (P-DMA1 trigger multiplexer)		
1:16	PDMA0_TR_OUT[0:15]	Allow P-DMA0 to trigger P-DMA1
17:24	PDMA1_TR_OUT[0:7]	Allow P-DMA1 to chain to itself, useful for triggering once per row for 2D transfer
25:28	MDMA_TR_OUT[0:3]	Allow M-DMA0 to trigger P-DMA0
29:32	FAULT_TR_OUT[0:3]	Allow faults to initiate data transfer for debug purposes
33:34	CTI_TR_OUT[0:1]	Trace events
35:38	EVTGEN_TR_OUT[7:10]	EVTGEN triggers
39:54	HSIOM_IO_INPUT[16:31]	I/O inputs
55:60	PASS_GEN_TR_OUT[0:5]	PASS SAR events
MUX Group 2: MDMA (M-DMA0 trigger multiplexer)		
1:4	MDMA_TR_OUT[0:3]	Allow M-DMA0 to trigger itself
MUX Group 3: TCPWM_TO_PDMA0 (TCPWM0 to P-DMA0 trigger multiplexer)		
1:8	TCPWM_32_TR_OUT0[0:7]	32-bit TCPWM0 counters
9:20	TCPWM_16M_TR_OUT0[0:11]	16-bit motor enhanced TCPWM0 counters
21:83	TCPWM_16_TR_OUT0[0:62]	16-bit TCPWM0 counters
84:87	CAN0_TT_TR_OUT[0:3]	CAN0 TT sync outputs
88:91	CAN1_TT_TR_OUT[0:3]	CAN1 TT sync outputs
MUX Group 4: TCPWM_OUT (TCPWM0 loop back multiplexer)		
1:8	TCPWM_32_TR_OUT0[0:7]	32-bit TCPWM0 counters
9:20	TCPWM_16M_TR_OUT0[0:11]	16-bit Motor enhanced TCPWM0 counters
21:83	TCPWM_16_TR_OUT0[0:62]	16-bit TCPWM0 counters
84:91	TCPWM_16_TR_OUT1[0:7]	Allows feedback of two signals from same counters
92:95	CAN0_TT_TR_OUT[0:3]	CAN0 TT sync outputs
96:99	CAN1_TT_TR_OUT[0:3]	CAN1 TT sync outputs

Note
32. "x:y" depicts a range starting from 'x' through 'y'.

23 Peripheral protection unit fixed structure pairs

Protection pair is a pair PPU structures, a master and a slave structure. The master structure protects the slave structure, and the slave structure protects resources such as peripheral registers, or the peripheral itself.

24 Bus masters

The Arbiter (part of flash controller) performs priority-based arbitration based on the master identifier. Each bus master has a dedicated 4-bit master identifier. This master identifier is used for bus arbitration and IPC functionality.

Table 24-1 Bus masters for access and protection control

ID No.	Master ID	Description
0	CPUSS_MS_ID_CM0	Master ID for Cortex®-M0+ CPU
1	CPUSS_MS_ID_CRYPTO	Master ID for Crypto
2	CPUSS_MS_ID_DW0	Master ID for P-DMA 0
3	CPUSS_MS_ID_DW1	Master ID for P-DMA 1
4	CPUSS_MS_ID_DMAC	Master ID for M-DMA0
14	CPUSS_MS_ID_CM4	Master ID for Cortex®-M4 CPU
15	CPUSS_MS_ID_TC	Master ID for DAP Tap controller

25 Miscellaneous configuration

Table 25-1 Miscellaneous configuration for CYT2BL devices

Sl. no.	Configuration	Number/ instances	Description
0	SRSS_NUM_CLKPATH	4	Number of clock paths. One for each of FLL, PLL, Direct and CSV
1	SRSS_NUM_HFROOT	3	Number of CLK_HFs roots present
2	PERI_PC_NR	8	Number of protection contexts
3	PERI_CLOCK_NR	124	Number of programmable clocks (outputs)
4	PERI_DIV_8_NR	32	Number of divide-by-8 clock dividers
5	PERI_DIV_16_NR	16	Number of divide-by-16 clock dividers
6	PERI_DIV_24_5_NR	8	Number of divide-by-24.5 clock dividers
7	CPUSS_CM0P_MPU_NR	8	Number of MPU regions in CM0+
8	CPUSS_CM4_MPU_NR	8	Number of MPU regions in CM4
9	CPUSS_CRYPTO_BUFF_SIZE	2048	Number of 32-bit words in the IP internal memory buffer (to allow for a 256-B, 512-B, 1-KB, 2-KB, 4-KB, 8-KB, 16-KB, and 32-KB memory buffer)
10	CPUSS_FAULT_FAULT_NR	4	Number of fault structures
11	CPUSS_IPC_IPC_NR	8	Number of IPC structures 0 - Reserved for CM0+ access 1 - Reserved for CM4 access 2 - Reserved for DAP access Remaining for user purposes
12	SCB0_EZ_DATA_NR	256	Number of EZ memory bytes. This memory is used in EZ mode, CMD_RESP mode and FIFO mode. Note: Only SCB0 supports EZ mode
13	CPUSS_PROT_SMPU_STRUCT_NR	16	Number of SMPU protection structures
14	TCPWM_TR_ONE_CNT_NR	3	Number of input triggers per counter, routed to one counter
15	TCPWM_TR_ALL_CNT_NR	27	Number of input triggers routed to all counters, based on the pin package
16	TCPWM_GRP_NR	3	Number of TCPWM0 counter groups
17	TCPWM_GRP_NR0_GRP_GRP_CNT_NR	63	Number of counters per TCPWM0 Group #0
18	TCPWM_GRP_NR0_CNT_GRP_CNT_WIDTH	16	Counter width in number of bits per TCPWM0 Group #0
19	TCPWM_GRP_NR1_GRP_GRP_CNT_NR	12	Number of counters per TCPWM0 Group #1
20	TCPWM_GRP_NR1_CNT_GRP_CNT_WIDTH	16	Counter width in number of bits per TCPWM0 Group #1
21	TCPWM_GRP_NR2_GRP_GRP_CNT_NR	8	Number of counters per TCPWM0 Group #2
22	TCPWM_GRP_NR2_CNT_GRP_CNT_WIDTH	32	Counter width in number of bits per TCPWM0 Group #2
23	CANFD0_MRAM_SIZE / CANFD1_MRAM_SIZE	32	Message RAM size in KB shared by all the channels
24	EVTGEN_COMP_STRUCT_NR	11	Number of event generator comparator structures

26 Development support

CYT2BL has a rich set of documentation, programming tools, and online resources to assist during the development process. Visit **www.infineon.com** to find out more.

26.1 Documentation

A suite of documentation supports CYT2BL to ensure that you can find answers to your questions quickly. This section contains a list of some of the key documents.

26.1.1 Software user guide

A step-by-step guide for using the sample driver library along with third-party IDEs such as IAR EWARM and GHS Multi.

26.1.2 Technical reference manual

The Technical Reference Manual (TRM) contains all the technical detail needed to use a CYT2BL device, including a complete description of all registers. The TRM is available in the documentation section at **www.infineon.com**.

26.2 Tools

CYT2BL is supported on third-party development tool ecosystems such as IAR and GHS. CYT2BL is also supported by Cypress programming utilities for programming, erasing, or reading using Cypress' MiniProg4 or Segger J-link. More details are available in the documentation section at **www.infineon.com**.

27 Electrical specifications

27.1 Absolute maximum ratings

Use of this device under conditions outside the Min and Max limits listed in **Table 27-1** may cause permanent damage to the device. Exposure to conditions within the limits of **Table 27-1** but beyond those of normal operation for extended periods of time may affect device reliability. The maximum storage temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When operated under conditions within the limits of **Table 27-1** but beyond those of normal operation, the device may not operate to specification.

Power considerations

The average chip-junction temperature, T_J, in °C, may be calculated using Equation 1:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Equation. 1}$$

Where:

T_A is the ambient temperature in °C.

θ_{JA} is the package junction-to-ambient thermal resistance, in °C/W.

P_D is the sum of P_{INT} and P_{IO} ($P_D = P_{INT} + P_{IO}$).

P_{INT} is the chip internal power. ($P_{INT} = V_{DDD} \times I_{DD} + V_{DDA} \times I_A$)

P_{IO} represents the power dissipation on input and output pins; user determined.

For most applications, $P_{IO} < P_{INT}$ and may be neglected.

On the other hand, P_{IO} may be significant if the device is configured to continuously drive external modules and/or memories.

SID15A	V_{I0_ABS0}	Input voltage[35]	V_{SSD} – 0.5	–	V_{DDD} + 0.5	V	For ports 0, 1, 2, 3, 4, 5, 16, 17, 18, 19, 20, 21, 22, 23
SID15B	V_{I1_ABS1}	Input voltage[35]	V_{SSD} – 0.5	–	V_{DDIO_1} + 0.5	V	For ports 6, 7, 8, 9[36]
SID15C	V_{I2_ABS2}	Input voltage[35]	V_{SSD} – 0.5	–	V_{DDIO_2} + 0.5	V	For ports 10, 11, 12, 13, 14, 15
SID16	V_{IA_ABS}	Analog input voltage[35]	V_{SSA} – 0.3	–	V_{DDA} + 0.3	V	
SID17A	V_{O0_ABS0}	Output voltage[35]	V_{SSD} – 0.3	–	V_{DDD} + 0.3		For ports 0, 1, 2, 3, 4, 5, 16, 17, 18, 19, 20, 21, 22, 23
SID17B	V_{O1_ABS1}	Output voltage[35]	V_{SSD} – 0.3	–	V_{DDIO_1} + 0.3	V	For ports 6, 7, 8, 9[36]
SID17C	V_{O2_ABS2}	Output voltage[35]	V_{SSD} – 0.3	–	V_{DDIO_2} + 0.3	V	For ports 10, 11, 12, 13, 14, 15
SID18	I_{CLAMP_ABS}	Maximum clamp current [37, 38, 39]	–5	–	5	mA	

Notes

35. These parameters are based on the condition that $V_{SSD} = V_{SSA} = 0.0$ V.
36. The I/Os in the V_{DDIO_1} domain refer to the V_{DDD} domain in the 64-LQFP package.
37. A current-limiting resistor must be provided such that the current at the I/O pin does not exceed rated values at any time, including during power transients. See **Figure 27-1** for more information on the recommended circuit.
38. V_{DDD} and V_{DDIO} must be sufficiently loaded or protected to prevent them from being pulled out of the recommended operating range by the clamp current.
39. When the conditions of [37], [38] and SID18A/B/C/D are met, $|I_{CLAMP\_ABS}|$ supersedes V_{IA_ABS} and V_{I_ABS}.

Table 27-1 Absolute maximum ratings *(continued)*

Notes
40. The definition of “closer” depends on the package. In LQFP packaging, “closest” is determined by counting pins. For example, in a 176-LQFP package, P17.4 (pin 120) is closer to the V_{DDD} on pin 110 than on pin 132. Ports 11 and 21 should not be used for injection currents. The impact of injection currents is only defined for GPIO_STD/GPIO_ENH type I/Os.
41. The maximum output current is the peak current flowing through any one GPIO.
42. The total output current is the maximum current flowing through all I/Os (GPIO_STD, and GPIO_ENH).

WARNING:
Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current, or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

27.2 Device-level specifications

Table 27-2 Recommended operating conditions

Spec ID	Parameter	Description	Min	Typ	Max	Units	Details/conditions
Recommended operating conditions							
SID40	V_{DDD}, V_{DDA}, V_{DDIO_1}, V_{DDIO_2},	Power supply voltage[44]	2.7[45]	–	5.5[46]	V	
SID40A	$V_{DDIO\_1\_EFP}$	Power supply voltage for eFuse programming[47]	3	–	5.5	V	
SID41	C_{S1}	Smoothing capacitor[48, 49]	3.76	–	11	µF	

Notes
43. +B is the positive battery voltage around 45 V.
44. V_{DDD}, V_{DDIO_1}, V_{DDIO_2}, and V_{DDA} do not have any sequencing limitation and can establish in any order. These supplies (except for V_{DDA} and V_{DDIO_2}) are independent in voltage level. See 12-Bit SAR ADC DC Specifications when using ADC units.
45. 3.0 V ±10% is supported with a lower BOD setting option for V_{DDD} and V_{DDA}. This setting provides robust protection for internal timing but BOD reset occurs at a voltage below the specified operating conditions. A higher BOD setting option is available (consistent with down to 3.0 V) and guarantees that all operating conditions are met.
46. 5.0 V ±10% is supported with a higher OVD setting option for V_{DDD} and V_{DDA}. This setting provides robust protection for internal and interface timing, but OVD reset occurs at a voltage above the specified operating conditions. A lower OVD setting option is available (consistent with up to 5.0 V) and guarantees that all operating conditions are met. Voltage overshoot to a higher OVD setting range for V_{DDD} and V_{DDA} is permissible, provided the duration is less than 2 hours cumulated. Note that during overshoot voltage condition electrical parameters are not guaranteed.
47. eFuse programming must be executed with the part in a “quiet” state, with minimal activity (preferably only JTAG or a single LIN/CAN channel on V_{DDD} domain, no activity on V_{DDIO_1}).
48. Smoothing capacitor, C_{S1} is required per chip (not per V_{CCD} pin). The V_{CCD} pins must be connected together to ensure a low-impedance connection (see the requirement in **Figure 27-2**).
49. Capacitors used for power supply decoupling or filtering are operated under a continuous DC-bias. Many capacitors used with DC power across them provide less than their target capacitance, and their capacitance is not constant across their working voltage range. When selecting capacitors for use with this device, ensure that the selected components provide the required capacitance under the specific operating conditions of temperature and voltage used in your design. While the temperature coefficient is normally found within a parts catalog (such as, X7R, C0G, Y5V), the matching voltage coefficient may only be available on the component datasheet or direct from the manufacturer. Use of components that do not provide the required capacitance under the actual operating conditions may cause the device to operate to less than datasheet specifications.

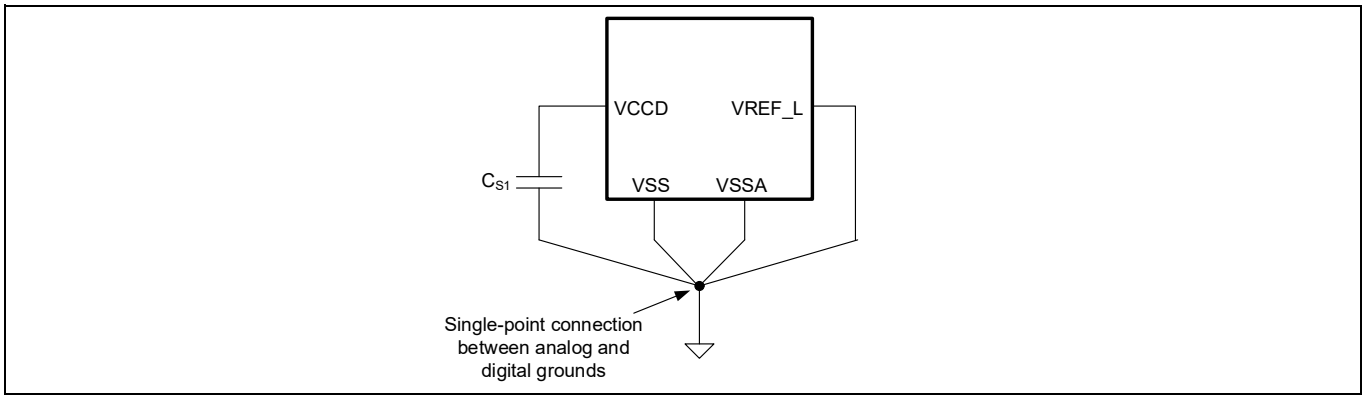

Figure 27-2 Smoothing capacitor

Smoothing capacitor should be placed as close as possible to the V_{CCD} pin.

SID56A	I_{DD_CWU2}	Average current for cyclic wake-up operation This is the average current for the specified LP Active mode and DeepSleep mode (RTC, WDT and Event generator operating).	–	46	136	µA	V_{DDD} = 5.5 V, T_A = 25 °C, 64-KB SRAM retention, ILO0 operation in DeepSleep, Smart I/O operations with ILO0, CM0+, CM4: Retain Typ: process typ (TT) Max: process worst (FF) This average current is achieved under the following conditions. 1. MCU repetitively goes from DeepSleep to LP Active with a period of 32 ms. 2. One of the I/Os is toggled using Smart I/O to activate an external sensor connected to an analog input of A/D in DeepSleep 3. After 200 µs delay, the CM4 wakes up by event generator trigger to LP Active mode with IMO and A/D conversion is triggered by software. 4. Group A/D conversion is performed on 5 channels with the sampling time of 1 µs each. 5. Once the group A/D conversion is finished, and the results fit in the window of the range comparator, the I/O is toggled back by software to de-activate the sensor and the CM4 goes back to DeepSleep.
SID59A	I_{DD_DS64B}	64-KB SRAM retention, ILO0 operation in DeepSleep mode	–	35	130	µA	DeepSleep Mode (RTC, WDT, and event generator operating, all other peripherals are off except for retention registers), T_A = 25 °C, CM0+, CM4: Retained Typ: V_{DDD} = 5.0 V, process typ (TT) Max: V_{DDD} = 5.5 V, process worst (FF)

52.V_{DDD} must be greater than 0.8 × V_{DDA} when ADC[2] is enabled. V_{DDIO_1} must be greater than 0.8 × V_{DDA} when ADC[0] is enabled.

27.6.2 Calculating the impact of neighboring pins

The three ADC specifications based on SID19A, SID19B, and SID19C, can be used to calculate the pin leakage and resulting ADC offset caused by injection current using the below formula:

$I_{LEAK} = I_{INJECTED} \times CLAMP\_COUPLING\_RATIO$
$V_{ERROR} = I_{LEAK} \times (R_{CLAMP\_INTERNAL} + R_{SOURCE})$
$Code\ Error = V_{ERROR} \times 2^{12} / V_{REF}$

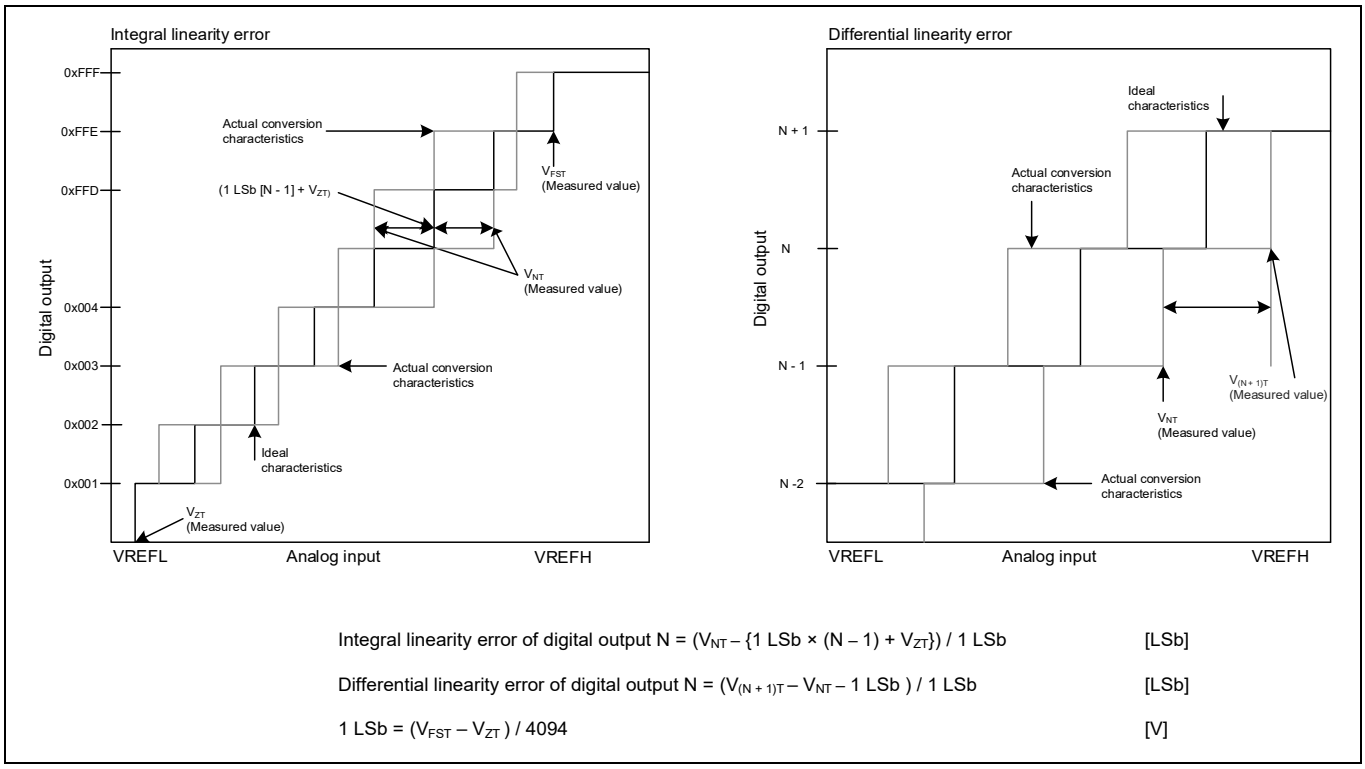
Where:

$I_{INJECTED}$ is the injected current in mA.

I_{LEAK} is the calculated leakage current in mA.

V_{ERROR} is the voltage error calculated due to leakage currents in V.

V_{REF} is the ADC reference voltage in V.



Integral linearity error of digital output N = $(V_{NT} - \{1\ LSb \times (N - 1) + V_{ZT}\}) / 1\ LSb$ [LSb]

Differential linearity error of digital output N = $(V_{(N+1)T} - V_{NT} - 1\ LSb\ ) / 1\ LSb$ [LSb]

$1\ LSb = (V_{FST} - V_{ZT}\ ) / 4094$ [V]

27.11 Clock specifications

All specifications are valid for –40 °C ≤ T_A ≤ 125 °C and for 2.7 V to 5.5 V except where noted.

The basic requirement on the clock-frequency dependency of the cores is that the Cortex-M0+ core should run at an integer divider from the Cortex-M4 core clock. Example combinations are listed in **Table 27-21**.

Table 27-21 Clock requirements

Core Cortex-M4 clock (MHz)	Core Cortex-CM0+ clock (MHz)
160	80
120	60
100	100
80	80

Table 27-22 Root and intermediate clocks[56]

Clock	Max permitted clock frequency (MHz)[57]	Source	Maximum permitted clock frequency setting (MHz)[57]		Description
			PLL/FLL Clock source: ECO[58]	PLL/FLL Clock source: IMO[59]	
CLK_HF0	160	PLL200#0	160	155	Root clock for CPUSS, PERI
		FLL	100	96	
	100	PLL200#0	100	98	
		FLL	100	96	
CLK_HF1	100	PLL200#0	100	98	Event generator (CLK_REF), Clock output on EXT_CLK pins (when used as output)
		FLL	100	96	
CLK_HF2	2	ILO	NA	NA	CSV
CLK_FAST	160	PLL200#0	160	155	Generated by dividing CLK_HF0, intermediate clock for CM4
		FLL	100	96	
	100	PLL200#0	100	98	
		FLL	100	96	
CLK_SLOW	100	PLL200#0	100	98	Generated by clock gating CLK_PERI, intermediate clock for CM0+, Crypto, P-DMA, M-DMA
		FLL	100	96	
CLK_PERI	100	PLL200#0	100	98	Generated by clock gating CLK_HF0, intermediate clock for LIN, SCB, PASS, CAN, TCPWM, CXPI, IOSS, CPU trace
		FLL	100	96	

Note

56. Intermediate clocks that are not listed have the same limitations as that of their parent clock.
57. Maximum clock frequency after the corresponding clock source (PLL/FLL + dividers). All internal tolerances and affects are covered by these frequencies.
58. For ECO: up to ±150 ppm uncertainty of the external clock source are tolerated by design.
59. The IMO operation frequency tolerance is included. When DeepSleep mode isn't used, maximum permitted clock frequency setting of clock source IMO case is equal to clock source ECO case.

Notes

64.Supported shipment types are “Tray” (default) and “Tape and Reel”. Add the character ‘T’ at the end to get the ordering code for “Tape and Reel” shipment type.
65.3DES/SHA-1/SHA-2/SHA-3/CRC/Vector unit for asymmetric cryptography features are not supported.
66.Code-flash size 4160 KB = 32 KB × 126 (Large Sectors) + 8 KB × 16 (Small Sectors).
67.Work-flash size 128 KB = 2 KB × 48 (Large Sectors) + 128 B × 256 (Small Sectors).
68.S-grade Temperature (–40 °C to 105 °C).
69.E-grade Temperature (–40 °C to 125 °C).
70.JTAG ID CODE bits 12 through 27, represents the Silicon ID of the device.

Notes
71. a1 = CTE (Coefficient of Thermal Expansion) value below T_g (ppm/°C) (T_g is glass transition temperature which is 131°C).
72. a2 = CTE value above T_g (ppm/°C).
73. Board condition complies to JESD51-7 (4 Layers).
74. Maximum value °C/Watt shown is for T_A = 125 °C.
75. The numbers are estimated values based simulation only and are based on a single bill of material combination per package type.

NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
3. DATUMS A–B AND D TO BE DETERMINED AT DATUM PLANE H.
4. TO BE DETERMINED AT SEATING PLANE C.
5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
6. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
7. REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
8. DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBAR PROTRUSION(S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
9. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
10. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

31 Appendix

31.1 Bootloading or end-of-line programming

- Triggered at device startup, if a trigger condition is applied
- Either CAN or LIN communication may be used
- Bootloader polls for the communication on CAN or LIN at separate time frames, until the overall 300-second timeout is reached
- If a bootloader command is received on either communication interface, the polling stops and bootloader starts using this interface

1. ConfigureFmInterrupt API assumes a parameter with 8-byte boundary but the actual boundary is 4 bytes	
Problem definition	STATUS_ADDR_PROTECTED will be returned if the ConfigureFmInterrupt API is called with arguments stored in SRAM with 4-byte boundary (available SRAM or protected boundary SRAM).
Parameters affected	NA
Trigger condition(s)	Call ConfigureFmInterrupt API with arguments stored in SRAM at 4-byte boundary of available SRAM or protected boundary of SRAM.
Scope of impact	ConfigureFmInterrupt API will fail by returning STATUS_ADDR_PROTECTED error status when called with argument having 4-byte boundary of available SRAM or protected boundary of SRAM.
Workaround	Allow 4 bytes margin (that is, assume that API parameter size is 8 and store the arguments) for the ConfigureFmInterruptAPI.
Fix status	No silicon fix planned. Use workaround.

2. SMPU/MPU/PPU protection region size is limited to 2 GB	
Problem definition	If SMPU/MPU/PPU protection block size is configured for 4 GB (PROT_SMPU_SMPU_STRUCT_ATT0.REGION.SIZE = 31), then during protection check in SROM, the value of the internal uint32 variable will overflow (4G = 0x1 0000 0000). Therefore, SROM assumes the protection size equals zero and no protection will be applied.
Parameters affected	NA
Trigger condition(s)	Configure SMPU/MPU/PPU to protect with region size equal to 4 GB or the region size with value 31u.
Scope of impact	If SMPU/MPU/PPU is configured to protect region size of 4 GB, then SROM software does not apply any protection per the request.
Workaround	Use two protection blocks of region size equal to 2 GB if 4-GB region size protection is required.
Fix status	No silicon fix planned. Use workaround.

3. DirectExecute API may return error if called with arguments placed in SRAM memory	
Problem definition	If DirectExecute API is called in the master PC (other than PC0 or PC1) with arguments in SRAM_SCRATCH_ADDR, then the API will return STATUS_ADDR_PROTECTED status.
Parameters affected	NA
Trigger condition(s)	Call DirectExecute API with arguments in SRAM_SCRATCH_ADDR and master PC configured > 1.
Scope of impact	DirectExecute API, if called with master PC configured > 1 and arguments in SRAM_SCRATCH_ADDR, will return STATUS_ADDR_PROTECTED.
Workaround	Call DirectExecute API with master PC0 or PC1 if the arguments are stored in SRAM memory.
Fix status	No silicon fix planned. Use workaround.

4. CAN FD RX FIFO top pointer feature does not function as expected	
Problem definition	RX FIFO top pointer function calculates the address for received messages in Message RAM by hardware. This address should restart from the start address after reading all messages of RX FIFO n size (n: 0 or 1). However, the address does not restart from the start address when RX FIFO n size is set to 1(CANFD_CH_RXFnC.FnS = 0x01). This results in CPU/DMA reading messages from the wrong address in Message RAM.
Parameters affected	NA
Trigger condition(s)	The RX FIFO top pointer function is used when RX FIFO n size is set to 1 element (CANFD_CH_RXFnC.FnS = 0x01).
Scope of impact	Received message cannot be correctly read by using the RX FIFO top pointer function, when RX FIFO n size is set to 1 element.
Workaround	Any of the following can be used as a workaround: 1) Set RX FIFO n size to 2 or more when using RX FIFO top pointer function. 2) Do not use the RX FIFO top pointer function when RX FIFO n size is set to 1 element. Instead of RX FIFO top pointer, read received messages from the Message RAM directly.
Fix status	No silicon fix planned. Use workaround.

5. CAN FD debug message handling state machine is not reset to Idle state when CANFD_CH_CCCR.INIT is set	
Problem definition	If either of the CANFD_CH_CCCR.INIT bits is set by the Host or when the M_TTCAN module enters BusOff state, the debug message handling state machine stays in its current state instead of being reset to Idle state. Configuring the bit CANFD_CH_CCCR.CCE does not change CANFD_CH_RXF1S.DMS.
Parameters affected	NA
Trigger condition(s)	Either of the CANFD_CH_CCCR.INIT bits is set by the Host or when the M_TTCAN module enters BusOff state.
Scope of impact	The errata is limited to the use case when the debug on CAN functionality is active. Normal operation of the CAN module is not affected, in which case the debug message handling state machine always remains in Idle state. In the described use case, the debug message handling state machine is stopped and remains in the current state signaled by the CANFD_CH_RXF1S.DMS bit. In case CANFD_CH_RXF1S.DMS is set to 0b11, the DMA request remains active.
Workaround	In case the debug message handling state machine has stopped while CANFD_CH_RXF1S.DMS is 0b01 or 0b10, it can be reset to Idle state by hardware reset or by reception of debug messages after CANFD_CH_CCCR.INIT is reset to zero.
Fix status	No silicon fix planned. Use workaround.

6. TPIU Peripheral ID mismatch	
Problem definition	TPIU peripheral ID indicates that it is M3-TPIU instead of M4-TPIU.
Parameters affected	NA
Trigger condition(s)	When debugger reads PID registers for component identification.
Scope of impact	The only impact is that the debugger reads the TPIU as M3-TPIU.
Workaround	No specific workaround required. Debugger can use trace features.
Fix status	No silicon fix planned.

7. CAN FD controller message order inversion when transmitting from dedicated Tx buffers configured with same Message ID	
Problem definition	Configuration: Several Tx buffers are configured with same Message ID. Transmission of these Tx buffers is requested sequentially with a delay between the individual Tx requests. Expected behavior: When multiple Tx buffers that are configured with the same Message ID have pending Tx requests, they shall be transmitted in ascending order of their Tx buffer numbers. The Tx Buffer with lowest buffer number and pending Tx request is transmitted first. Observed behavior: It may happen, depending on the delay between the individual Tx requests, that in the case where multiple Tx buffers are configured with the same Message ID the Tx buffers are not transmitted in order of the Tx buffer number (lowest number first).
Parameters affected	NA
Trigger condition(s)	When multiple Tx buffers that are configured with the same Message ID have pending Tx requests.
Scope of impact	In the case described it may happen, that Tx buffers configured with the same Message ID and pending Tx request are not transmitted with lowest Tx buffer number first (message order inversion).
Workaround	Any of the following: 1) First write the group of Tx message with the same Message ID to the Message RAM and then afterwards request transmission of all these messages concurrently by a single write access to CANFDx_CHy_TXBAR. Before requesting a group of Tx messages with this Message ID ensure that no message with this Message ID has a pending Tx request. 2) Use the Tx FIFO instead of dedicated Tx buffers for the transmission of several messages with the same Message ID in a specific order. Applications not able to use workaround #1 or #2 can implement a counter within the data section of their messages sent with same ID in order to allow the recipients to determine the correct sending sequence.
Fix status	No silicon fix planned. Use workaround.

8. CAN FD incomplete description of dedicated Tx buffers and Tx queue related to transmission from multiple buffers configured with the same Message ID	
Problem definition	The following are the updated description in Sections "Dedicated Tx Buffers" and "Tx Queue" of the Architecture TRM related to the transmission from multiple buffers configured with the same Message ID. Dedicated Tx buffers - TRM Statement: If multiple Tx buffers are configured with the same Message ID, the Tx buffer with the lowest buffer number is transmitted first. - Enhancement: These Tx buffers shall be requested in ascending order with lowest buffer number first. Alternatively all Tx buffers configured with the same Message ID can be requested simultaneously by a single write access to CANFDx_CHy_TXBAR. Tx Queue - TRM Statement: If multiple queue buffers are configured with the same Message ID, the queue buffer with the lowest buffer number is transmitted first. - Replacement: In case that multiple Tx Queue buffers are configured with the same Message ID, the transmission order depends on numbers of the buffers where the messages were stored for transmission. As these buffer numbers depend on the then current states of the PUT Index, a prediction of the transmission order is not possible. - TRM Statement: An Add Request cyclically increments the Put Index to the next free Tx buffer. - Replacement: The PUT Index always points to the free buffer of the Tx Queue with the lowest number.
Parameters affected	NA
Trigger condition(s)	Using multiple dedicated Tx buffers or Tx Queue buffers configured with the same Message ID.

Scope of impact	In the case the dedicated Tx buffers with the same Message ID are not requested in ascending order or at the same time or in case of multiple Tx Queue buffers with the same Message ID, it cannot be guaranteed, that these messages are transmitted in ascending order with lowest buffer number first.
Workaround	In case a defined order of transmission is required the Tx FIFO shall be used for transmission of messages with the same Message ID. Alternatively dedicated Tx buffers with the same Message ID shall be requested in ascending order with lowest buffer number first or by a single write access to CANFDx_CHy_TXBAR. Alternatively a single Tx buffer can be used to transmit those messages one after the other.
Fix status	No silicon fix planned. Use workaround. TRM was updated accordingly.

9. Misleading status is returned for Flash and eFuse system calls, if there are pending NC ECC faults in SRAM controller #0	
Problem definition	Flash and eFuse system calls will return misleading status of 0xF0000005 (“Page is write protected”) even for non-protected row, or 0xF0000002 (“Invalid eFuse address”) for valid eFuse address in case of pending NC ECC faults in SRAM controller #0.
Parameters affected	Return status of Flash and eFuse system calls.
Trigger condition(s)	NC ECC fault(s) pending in SRAM controller #0 and SWPUs are populated in the design.
Scope of impact	Flash and eFuse system calls will not work until the NC ECC fault(s) pending in SRAM controller #0 is/are properly handled.
Workaround	If the NC ECC fault(s) are not due to HW malfunction (i.e. if the faults are due to usage of non-initialized SRAM or improper SRAM initialization), then clearing of these pending faults will resolve the issue.
Fix status	No silicon fix planned. TRM will be updated accordingly.

10.WDT reset causes loss of SRAM retention	
Problem Definition	Architecture TRM table on “Reset Cause Distribution” shows that the WDT reset can retain SRAM if there is an orderly shutdown of the SRAM only during a warning interrupt. However, this is wrong. WDT reset causes loss of SRAM retention.
Parameters Affected	NA
Trigger Condition(s)	WDT reset
Scope of Impact	WDT reset causes loss of SRAM retention.
Workaround	None
Fix Status	No silicon fix planned. TRM will be updated.

11.Crypto ECC errors may be set after boot with application authentication	
Problem Definition	Due to the improper initialization of the Crypto memory buffer, Crypto ECC errors may be set after boot with application authentication.
Parameters Affected	N/A
Trigger Condition(s)	Boot device with application authentication.
Scope of Impact	Crypto ECC errors may be set after boot with application authentication.
Workaround	Clear or ignore Crypto ECC errors which generated during boot with application authentication.
Fix Status	No silicon fix planned. TRM will be updated.

12.Incomplete erase of Code Flash cells could happen Erase Suspend / Erase Resume is used along with Erase Sector operation in Non-Blocking mode	
Problem Definition	Code Flash memory can be erased in “Non-Blocking” mode; a Non-Blocking mode supported option allows users to suspend an ongoing erase sector operation. When an ongoing erase operation is interrupted using “Erase Suspend” and “Erase Resume”, Flash cells may not have been erased completely, even after the erase operation complete is indicated by FLASHC_STATUS register. Only Code Flash is impacted by this issue, Work Flash and Supervisory Flash (SFlash) are not impacted.
Parameters Affected	N/A
Trigger Condition(s)	Using EraseSector System Call in Non-Blocking mode for CM0+ to erase Code Flash and the ongoing erase operation is interrupted using EraseSuspend and EraseResume System calls.
Scope of Impact	When Code Flash sectors are erased in Non-Blocking mode and the ongoing erase operation is interrupted by Erase Suspend / Erase Resume, it cannot be guaranteed that the Code Flash cells are fully erased. Any read on the Code Flash area after the erase is complete or read on the programmed data after ProgramRow is complete can trigger ECC errors.
Workaround	Use any of the following: 1) User can use Non-Blocking mode for EraseSector, but must not interrupt the erase operation using Erase Suspend / Erase Resume. 2) If a Code Flash sector erase operation is interrupted using Erase Suspend / Erase Resume, then erase the same sector again without Erase Suspend / Erase Resume before reading the sector or programming the sector.
Fix Status	Will be fixed to update the Flash settings, via Manufacturing Test Program Update for Code Flash setting; this fix is transferred to TRAVEO™ T2G devices during Infineon Factory Test Flow. Fixed devices will be identified by Device Date Code, which is marked on every TRAVEO™ T2G device.

13.Limitation for keeping the port state from peripheral IP after wakeup from DeepSleep	
Problem Definition	The port state is not retained when the port selects peripheral IP (except LIN or CAN FD) and MCU wakes up from DeepSleep.
Parameters Affected	N/A
Trigger Condition(s)	The port selects peripherals (except LIN or CAN FD) and MCU wakes up from DeepSleep.
Scope of Impact	Unexpected port output change might affect user system.
Workaround	If the port selects peripherals (except for LIN or CAN FD), and the port output value needs to be maintained after wakeup from DeepSleep, set HSIOM_PRTx_PORT_SEL.IOy_SEL = 0 (GPIO) before DeepSleep and set the required output value in GPIO configuration registers. After wakeup, change HSIOM_PRTx-_PORT_SEL.IOy_SEL back to the peripheral module as needed.
Fix Status	No silicon fix planned. TRM will be updated to add above workaround.

Note 46 in “27 Electrical Specifications”	Updated description	5.0 V ±10% is supported with a higher OVD setting option for VDDD and VDDA. This setting provides robust protection for internal and interface timing, but OVD reset occurs at a voltage above the specified operating conditions. A lower OVD setting option is available (consistent with up to 5.0 V) and guarantees that all operating conditions are met.	5.0 V ±10% is supported with a higher OVD setting option for VDDD and VDDA. This setting provides robust protection for internal and interface timing, but OVD reset occurs at a voltage above the specified operating conditions. A lower OVD setting option is available (consistent with up to 5.0 V) and guarantees that all operating conditions are met. Voltage overshoot to a higher OVD setting range for VDDD and VDDA is permissible, provided the duration is less than 2 hours cumulated. Note that during overshoot voltage condition electrical parameters are not guaranteed.	Correction
