Stresses in excess of the absolute maximum ratings can permanently damage the device. Functional operation is not implied at these or any other conditions in excess of conditions represented in the operational sections of this datasheet. Exposure to absolute maximum ratings for extended periods may adversely affect device reliability. Permanent damage is also possible if OD or Vc is applied before V_{DD}.

Reliability

Vectron qualification includes aging at various extreme temperatures, shock and vibration, temperature cycling, and IR reflow simulation. The VX-805 family is capable of meeting the following qualification tests:

Table 8. Environmental Compliance					
Parameter	Conditions				
Mechanical Shock	MIL-STD-883, Method 2002				
Mechanical Vibration	MIL-STD-883, Method 2007				
Solderability	MIL-STD-883, Method 2003				
Gross and Fine Leak	MIL-STD-883, Method 1014

Moisture Sensitivity Level	MSL 1				
Contact Pads	Gold (0.3 um min to 1.0um max) over Nickel				
Weight	57 mg				

Handling Precautions

Although ESD protection circuitry has been designed into the VX-805 proper precautions should be taken when handling and mounting. Vectron employs a human body model (HBM) and a charged device model (CDM) for ESD susceptibility testing and design protection evaluation.

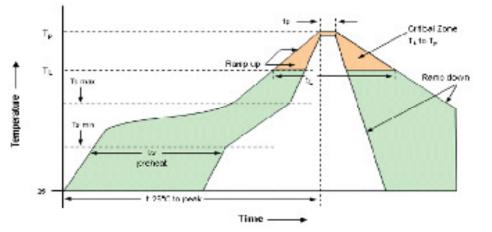

Table 9. ESD Ratings							
Model	Minimum	Conditions					
Human Body Model	500V	MIL-STD-883, Method 3015					
Charged Device Model	500V	JESD22-C101

Time To Peak Temperature	T _{AMB-P}	480 sec Max			
Time at 260 °C	t _e	30 sec Max			
Ramp Down	R _{DN}	6 °C/sec Max			

The device is qualified to meet the JEDEC standard for Pb-Free assembly. The temperatures and time intervals listed are based on the Pb-Free small body requirements. The VX-805 device is hermetically sealed so an aqueous wash is not an issue.
