TEXAS INSTRUMENTS

CDCUN1208LP 400-MHz Low Power 2:8 Fan-Out Buffer With Universal Inputs and Outputs

1 Features

- Supports PCIe Gen1, Gen2, Gen3
- Configuration Options (Through Pins or SPI/I^2C):
  - Input Type (HCSL, LVDS, LVCMOS)
  - Output Type (HCSL, LVDS, LVCMOS)
  - Signal Edge Rate (Slow, Medium, Fast)
  - Clock Input Divide Value (/1, /2, /4, /8) – IN2 Only
- Low-Power Consumption and Power Management Features, Including 1.8-V Operation and Output Enable Control
- Integrated Voltage Regulators to Improve PSNR
- Excellent Additive Jitter Performance
  - 200 fs RMS (10 kHz to 20 MHz), LVDS at 100 MHz
  - 160 fs RMS (10 kHz to 20 MHz), HCSL at 100 MHz
- Maximum Operating Frequency:
  - Differential Mode: up to 400 MHz
  - LVCMOS Mode: up to 250 MHz
- ESD Protection Exceeds 2-kV HBM, 500-V CDM
- Industrial Temperature Range (–40°C to 85°C)
- Wide Supply Range (1.8 V, 2.5 V, or 3.3 V)

2 Applications

- Communications and Computing Systems
- Factory Automation and Control
- Medical Imaging
- Pro Audio, Video and Signage
- Motor Drives

3 Description

The CDCUN1208LP is a 2:8 fan-out buffer featuring a wide operating supply range, two universal differential/single-ended inputs, and universal outputs (HCSL, LVDS, or LVCMOS) with edge-rate control. The clock buffer supports PCIe Gen1, Gen2 and Gen3. One of the device inputs includes a divider that provides divide values of /1, /2, /4, or /8. The CDCUN1208LP is offered in a 32-pin QFN package, reducing the solution footprint. The device is flexible and easy to use. The state of certain pins determines device configuration at power up. Alternately, the CDCUN1208LP provides a SPI/I^2C port with which a host processor controls device settings. The CDCUN1208LP delivers excellent additive jitter performance, and low power consumption. The output section includes four dedicated supply pins enabling the operation of output ports from different power supply domains. This provides the ability to clock devices switching at different LVCMOS levels without the need for external logic level translation circuitry.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
CDCUN1208LP	VQFN (32)	5.00 mm × 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Pin Configuration Overview

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (March 2017) to Revision D   **Page**

- Changed applications list 1
- Added type descriptions to the *Pin Functions* table 4
- Changed input voltage maximum from: VDDx + 0.5 to: V_{DD} + 0.5 in the *Absolute Maximum Ratings* table 6
- Added the junction temperature range to the *Absolute Maximum Ratings* table 6
- Changed the output current unit from mA °C to mA and moved the °C unit to the storage temperature parameter in the *Absolute Maximum Ratings* table 6
- Added note on V_{DD} and V_{DDOx} supply voltages 6
- Added text "Pull ADDR to GND for I2C communication" to the *CDCUN1208LP Host Configuration Pins* table 29
- Changed *SPI Message Format* graphic to correct SCS timing. 30
- Changed *CDCUN1208LP Device Addressing - SPI Mode* graphic to correct SCS timing. 30
- Changed *SPI Timing Diagram* graphic to correct SDI 31
- Changed t_3 in *SPI Timing Specifications* table to "SDI to SCL hold time" 32
- Changed t_8 in *SPI Timing Specifications* table to "SCL falling edge to SCS release time" 32
- Changed I^{2}C address to 7b'0101000 in *CDCUN1208LP I^{2}C Message - Addressing* graphic 34
- Changed description to reflect that the I^{2}C address is 7b'0101000 in *CDCUN1208LP Device Addressing (I^{2}C Address)* section 34
- Added content to the *Application Information* section 39

Changes from Revision B (July 2013) to Revision C **Page**

Changes from Revision A (January 2013) to Revision B **Page**

Changes from Original (May 2012) to Revision A **Page**

5 Pin Configuration and Functions

RHB Package
VQFN 32-Pin
Top View
Pin Functions[1]

PIN		TYPE	DESCRIPTION
NAME	NO.		
GND	Thermal Pad	Power	Power supply ground and thermal relief
DIVIDE	1	Input	Input divider pin control (HIGH = /4, LOW = /2, OPEN = /1)
INSEL	2	Input	Input multiplexer control
IN1P	3	Input	Universal input 1 – positive terminal
IN1N	4	Input	Universal input 1 – negative terminal, ground if using IN1 in single-ended mode
VDD	5	Power	Device power supply; provides power to the input section and clock distribution section. Use a power supply voltage that corresponds to the switching levels of clock inputs (such as 1.8 V, 2.5 V, or 3.3 V).
IN2P	6	Input	Universal input 2 – positive terminal
IN2N	7	Input	Universal input 2 – negative terminal, ground if using IN2 in single-ended mode
ITTP	8	Input	Input type select (HIGH = HCSL, LOW = LVDS, OPEN = LVCMOS)
OUT1P	9	Output	Output 1 – positive terminal
OUT1N	10	Output	Output 1 – negative terminal
VDDO1	11	Power	Output power supply – OUT1, OUT2
OUT2P	12	Output	Output 2 – positive terminal
OUT2N	13	Output	Output 2 – negative terminal
VDDO2	14	Power	Output power supply – OUT3, OUT4; output bank OUT1 – OUT4 regulator power supply (apply power if any of OUT1 – OUT4 are needed)
OUT3P	15	Output	Output 3 – positive terminal
OUT3N	16	Output	Output 3 – negative terminal
OUT4P	17	Output	Output 4 – positive terminal
OUT4N	18	Output	Output 4 – negative terminal

(1) This pin list applies to operation of the device in pin mode. In host mode, certain pins take on an alternate function, as outlined in Table 8.

Product Folder Links: *CDCUN1208LP*

Pin Functions[1] (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
OTTP	19	Output	Output type select (HIGH = HCSL, LOW = LVDS, OPEN = LVCMOS)
OUT5P	20	Output	Output 5 – positive terminal
OUT5N	21	Output	Output 5 – negative terminal
VDDO3	22	Power	Output power supply - OUT5, OUT6
OUT6P	23	Output	Output 6 – positive terminal
OUT6N	24	Output	Output 6 – negative terminal
OUT7P	25	Output	Output 7 – positive terminal
OUT7N	26	Output	Output 7 – negative terminal
VDDO4	27	Power	Output power supply – OUT7, OUT8 output bank OUT5 – OUT8 regulator power supply (apply power if any of OUT5 – OUT8 are needed)
OUT8P	28	Output	Output 8 – positive terminal
OUT8N	29	Output	Output 8 – negative terminal
MODE	30	Input	Device control mode select OPEN = Device configured through pins (pin mode) HIGH = Device configured through I^2C LOW = Device configured through SPI Note: For information on control through the serial interface (I^2C/ SPI), see *Device Control Using the Host Interface* section.
ERC	31	Input	Output edge rate control HIGH = Medium, LOW = Slow, OPEN = Fast
OE	32	Input	Device output enable HIGH = Enable, LOW = Disable

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) [1]

		MIN	MAX	UNIT
V_{DDxx}	Supply voltage[2]	−0.5	4.6	V
V_{IN}	Input voltage[3]	−0.5	V_{DD} + 0.5	V
V_{OUT}	Output voltage[3]	−0.5	V_{DDOx} + 0.5	V
I_{IN}	Input current	20		mA
I_{OUT}	Output current	50		mA
T_J	Junction temperature		125	°C
T_{stg}	Storage temperature	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
(2) All supply voltages must be supplied simultaneously
(3) The input and output negative voltage ratings may be exceeded if the input and output clamp–current ratings are observed.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

T_A = −40°C TO 85°C

			MIN	NOM	MAX	UNIT
POWER SUPPLIES[1][2][3]						
V_{DD}	DC power supply - core	1.8-V mode	1.7	1.8	1.9	V
V_{DDOx}	DC power supply - output	1.8-V mode	1.7	1.8	1.9	V
V_{DD}	DC power supply - core	2.5-V mode	2.375	2.5	2.625	V
V_{DDOx}	DC power supply - output	2.5-V mode	2.375	2.5	2.625	V
V_{DD}	DC power supply - core	3.3-V mode	2.97	3.3	3.63	V
V_{DDOx}	DC power supply - output	3.3-V mode	2.97	3.3	3.63	V
$\Delta V/\Delta T^2$	Core power supply slew rate	0.4-V to 1.8-V × 0.8 (in all voltage modes)	6500			V/s
TEMPERATURE						
T_A	Free- air temperature		−40		85	°C

(1) For proper device operation, the core power supply voltage (pin 5) must be applied either before the application of any output power supply, or simultaneously with the application of the output power supplies. The application of an output power supply prior to the application of the core power supply could result in improper device behavior.
(2) A minimum V_{DD} slew rate of 6500 V/s should be obtained to ensure proper device functionality in pin mode. If the ambient temperature of the device is > 0°C, the slew rate can be as slow as 5000 V/s. In host mode (I^2C/SPI), the V_{DD} slew rate is not limited, if the Reset bit gets toggled after V_{DD} ramp.
(3) V_{DD} and V_{DDOx} can be operated from different supply voltages. Refer to Configuration of Output Type (OTTP) for more details.

6.4 Thermal Information

THERMAL METRIC[1]		CDCUN1208LP RHB Package 32 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	32.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	24.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	6.6	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	6.6	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.6	°C/W

(1)   For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report.

6.5 Digital Input Electrical Characteristics – OE (SCL), INSEL, ITTP, OTTP, Divide (SDA/MOSI), ERC(ADDR/CS), Mode

$T_A = -40°C$ to 85°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
LVCMOS INPUT						
$V_{IL1.8}$	Low-level LVCMOS input voltage	$V_{DD} = 1.8$ V			0.7	V
$V_{IH1.8}$	High-level LVCMOS input voltage	$V_{DD} = 1.8$ V	1.35			V
$V_{IOPEN1.8}$	OPEN-level LVCMOS input voltage	$V_{DD} = 1.8$ V	0.75		1.2	V
$V_{IL2.5}$	Low-level LVCMOS input voltage	$V_{DD} = 2.5$ V			0.7	V
$V_{IH2.5}$	High-level LVCMOS input voltage	$V_{DD} = 2.5$ V	1.71			V
$V_{IOPEN2.5}$	OPEN-level LVCMOS input voltage	$V_{DD} = 2.5$ V	1		1.6	V
$V_{IL3.3}$	Low-level LVCMOS input voltage	$V_{DD} = 3.3$ V			1	V
$V_{IH3.3}$	High-level LVCMOS input voltage	$V_{DD} = 3.3$ V	2.3			V
$V_{IOPEN3.3}$	OPEN-level LVCMOS input voltage	$V_{DD} = 3.3$ V	1.3		1.9	V
I_{IL}	Low-level LVCMOS input current	$V_{DD} = V_{DDmax}$, $V_{ILCMOS} = 0$ V			−120	µA
I_{IH}	High-level LVCMOS input current	$V_{DD} = V_{DDmax}$, $V_{IHCMOS} = 1.9$ V			65	µA
C_I	LVCMOS input capacitance			6		pF
V_{IK}	Digital input clamp voltage	$V_{DD} = 1.7$V, $I_I = -18$ mA			−1.2	V

6.6 Universal Input (IN1, IN2) Characteristics

V_{DD} = 1.8 V, 2.5 V, 3.3 V, T_A = –40°C to 85°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SINGLE-ENDED MODE						
$f_{IN1,2}$	Input frequency	Single ended[1]	0.008		250	MHz
V_{IH}	Input voltage - high	250 MHz	$0.7 \times V_{DD}$		V_{DD}	V
V_{IL}	Input voltage - low	250 MHz			$0.2 \times V_{DD}$	V
DIFFERENTIAL MODE						
f_{INDIFF}	Input frequency		0.008		400	MHz
$|V_{IN\text{-}DIFF}|$	Input swing	V_{DD} = 2.5 V, 3.3 V	0.15		1.6	V
		V_{DD} = 1.8 V	0.15		1	V
V_{CM}	Input common mode voltage	ITTP = LVDS, V_{DD} = 3.3 V	0.8		2.5	V
		ITTP = LVDS, V_{DD} = 2.5 V, 1.8 V	0.8		$V_{DD} - 0.3$	
		ITTP = HCSL	–0.15		0.75	
GENERAL CHARACTERISTICS						
I_{IH}	Input current - high	V_{DD} = 3.63 V, V_{IH} = 3.63 V			30	µA
I_{IL}	Input current - low	V_{DD} = 3.63 V, V_{IL} = 0 V			–30	µA
$\Delta V/\Delta T$	Input edge rate	20%–80%	0.75			V/ns
DC_{IN}	Input duty cycle		40%		60%	
C_{IN}	Input capacitance			3.5		pF

(1) When using an input in single-ended mode, ground the negative terminal (IN1N and/or IN2N) and drive the positive terminal (IN1P and/or IN2P).

6.7 Clock Output Buffer Characteristics (Output Mode = LVDS)

Unless otherwise noted, V_{DDOX} = 1.8 V, 2.5 V, 3.3 V; T_A = –40°C to 85°C. See Figure 15, Figure 16, and Figure 17.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{OUT}	Output frequency		0.008		400	MHz
V_{CM}	Output common mode voltage, VDDOx = 2.5/3.3 V	R_L = 100 Ω	1.125	1.2	1.275	V
	Output common mode voltage, VDDOx = 1.8 V	R_L = 100 Ω		0.9		V
$|V_{OD}|$	Differential output voltage	R_L = 100 Ω, single-ended Pk-Pk	250	400	550	mV
ΔV_{OD}	Change in magnitude of VOD for complementary output states	R_L = 100 Ω	–50		50	mV
V_{ring}	Output overshoot and undershoot	Percentage of output amplitude VOD			20%	
V_{OS}	Output AC common mode	$V_{IN, DIFF, PP}$ = 0.9 V, R_L = 100 Ω, 2 pF			150	mVP-P
T_{ADDJIT}	Additive jitter[1]	f_{out} = 100 MHz, 10k-20M integration bandwidth, R_L = 100 Ω			200	fs, rms
		f_{out} = 400 MHz, 10k-20M integration bandwidth, R_L = 100 Ω			180	
t_R/t_F	Output rise/fall time	ERC = Slow, 20% to 80%, Z_L = 100 Ω, 1pF, V_{DDOx} = 3.3 V		800		ps
		ERC = Slow, 20% to 80%, Z_L = 100 Ω, 1pF, V_{DDOx} = 1.8 V		700		
		ERC = Medium., 20% to 80%, Z_L = 100 Ω, 1pF, V_{DDOx} = 3.3 V		600		
		ERC = Medium., 20% to 80%, Z_L = 100 Ω, 1pF, V_{DDOx} = 1.8 V		500		
		ERC = Fast, 20% to 80%, Z_L = 100 Ω, 1 pF		300		
ODC	Output duty cycle	50/50 Input duty cycle	45%		55%	
I_{SP} I_{SN}	Output short circuit current (single ended)	Shorted to GND	–24		24	mA
$|I_{PN}|$	Output short circuit current (differential)	Complementary outputs shorted together			12	mA
T_{DLYO}	Propagation delay	ERC set to high rate. Input t_r, t_f > 0.6 V/ns, R_L = 100 Ω, V_{DD} = 2.5 V, 3.3 V		3.3		ns
		ERC set to high rate. Input t_r, t_f > 0.6 V/ns, R_L = 100 Ω, V_{DD} = 1.8 V		3.8		
t_{SKEW}	Skew between outputs	ERC set to high rate. Input t_r, t_f > 0.6 V/ns, Equal VDDOx, R_L = 100 Ω		35	50	ps
t_{OE}	Output enable to stable clock output	Pin mode. f_{out} = 100 MHz, device in active mode with outputs disabled, OE asserted		20		μs
t_{PD}	PD de-asserted to stable clock output	Host mode, f_{out} = 100 MHz, device in power down mode, PD de-asserted		20		μs
t_{PU}	Time from power applied to stable clock output[2]	Pin mode, f_{out} = 100 MHz, OE asserted, measured from time V_{DD} is valid to stable output.		1		ms

(1) t_{Rfin} = t_{Ffin} > 0.6 V/ns.
(2)   Parameter depends significantly on power supply design and supply voltage rise time.

Product Folder Links: CDCUN1208LP

6.8 Clock Output Buffer Characteristics (Output Mode = HCSL)

Unless otherwise noted, V_{DDOx} = 1.8 V, 2.5 V, 3.3 V; T_A = –40°C to 85°C. See Figure 18, Figure 19, and Figure 20.
Supporting PCIe Gen1, Gen2, Gen3.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{OUT}	Output frequency		0.008		400	MHz
Vmax	Absolute maximum output voltage[1]	See Figure 1			1.15	V
Vmin	Absolute minimum output voltage[2]	See Figure 1	–0.3			V
V_{OH}	Single-ended output voltage – high[3]	R_L = single ended to GND = 50 Ω, C_L = 2 pF, VDDOx = 2.5 V, 3.3 V See Figure 18	600			mV
		R_L = single ended to GND = 50 Ω, C_L = 2 pF, VDDOx = 1.8 V See Figure 18	550			
V_{OL}	Single-ended output voltage – low[3]	R_L = single ended to GND = 50 Ω, C_L = 2 pF, See Figure 18			150	mV
V_{CROSS}	Output crossing point voltage[3]	See Figure 1	250		550	mV
$V_{CROSS\Delta}$	V_{CROSS} Total variation[3]	See Figure 2			140	mV
V_{RB}	Ring back voltage margin[3]	See Figure 3	–100		100	mV
T_{STABLE}	Time before V_{RB} is Allowed[3],[4]	See Figure 3	500			ps
V_{OS}	Output AC common mode	$V_{IN, DIFF, PP}$ = 0.9 V, R_L = single ended to GND = 50 Ω, 2 pF		75	125	mV_{P-P}
$T_{jitHCSL}$	Additive jitter, input set to HCSL[5]	f_{OUT} = 100 MHz, 10k-20M integration bandwidth. Differential measurement			380	fs, rms
$T_{jitLVDS}$	Additive jitter, input set to LVDS[5]	f_{OUT} = 100 MHz, 10k-20M integration bandwidth. Differential measurement			280	fs, rms
t_R/t_F	Output rise/fall time[6]	Slow, +150-mV differential, see Figure 4, V_{DDOx} = 3.3 V		300		ps
		Slow, +150-mV differential, see Figure 4, V_{DDOx} = 1.8 V		230		
		Med., +150-mV differential, see Figure 4, V_{DDOx} = 3.3 V		240		
		Med., +150-mV differential, see Figure 4, V_{DDOx} = 1.8 V		180		
		Fast, +150-mV differential, see Figure 4		140		
TM_{RF}	Output rise/fall time matching	See Figure 5			20%	
ODC	Output duty cycle[7]	Differential measurement, see Figure 6	45%		55%	
T_{DLYO}	Propagation delay	ERC set to high rate. Input t_r, t_f > 0.6 V/ns, V_{DD} = 2.5 V, 3.3 V			3.8	ns
		ERC set to high rate. Input t_r, t_f > 0.6 V/ns, V_{DD} = 1.8 V			4.3	
t_{SKEW}	Skew between outputs[8]	Differential Measurement, Input t_r, t_f > 0.6 V/ns		35	50	ps
t_{OE}	Output enable to stable clock output	Pin mode, f_{out} = 100 MHz, device in active mode with outputs disabled, OE asserted		2		μs
t_{PD}	PD de-asserted to stable clock output	Host mode, f_{out} = 100 MHz, device in power down mode, PD de-asserted		15		μs
t_{PU}	Time from power applied to stable clock output[9]	Pin mode, f_{out} = 100 MHz, OE asserted, measured from time V_{DD} is valid to stable output		1		ms

(1) Single-ended measurement includes overshoot. Measurement is taken at load capacitors C_L (see Figure 18).
(2) Single-ended measurement, includes undershoot. Measurement is taken at load capacitors C_L (see Figure 18).
(3) Measurement is taken at load capacitors C_L (see Figure 18). If VDDOx = 1.8 V, the specified minimum V_{OH} is 550 mV.
(4) TSTABLE is the time the differential clock must maintain a minimum ±150 mV differential voltage after rising/falling edges, before it is allowed to return into the VRB ±100 mV differential range. See Figure 3.
(5) t_{Rfin} = t_{Ffin} ≥ 0.6 V/ns.
(6) Measured from –150 mV to +150 mV on the differential waveform. The signal must be monotonic through the measurement region for rise and fall time. The 300-mV measurement window is centered on the differential zero crossing. Slow is 0.53 V/ns, medium is 1.05 V/ns, and fast is 2.1 V/ns. The PCIe CEM spec. has a window of 0.6 V/ns to 4 V/ns.
(7) Assumes input duty cycle = 50%.
(8) Skew measured between identical output types with identical loads, identical output power supplies, and identical edge rate settings.
(9) Parameter depends significantly on power supply design and supply voltage rise time.

Product Folder Links: *CDCUN1208LP*

6.9 Clock Output Buffer Electrical Characteristics (Output Mode = LVCMOS)

Unless otherwise noted, V_{DDOx} as shown in Table sections, T_A = –40°C to 85°C. ERC = Fast. For test configurations, see Figure 21 and Figure 22.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
3.3-V MODE						
f_{out}	Output frequency range		0.0008		250	MHz
V_{OH}	LVCMOS high-level output voltage	V_{DDOx} = 2.97 V, I_{OH} = –0.1 mA (All ERC Settings)	2.9			V
		V_{DDOx} = 2.97 V, I_{OH} = –5 mA (ERC = SLOW)	2.4			V
		V_{DDOx} = 2.97 V, I_{OH} = –8 mA (ERC = MED, FAST)				
		V_{DDOx} = 2.97 V, I_{OH} = –6 mA (ERC = SLOW)	2.2			V
		V_{DDOx} = 2.97 V, I_{OH} = –10 mA (ERC = MED)				
		V_{DDOx} = 2.97 V, I_{OH} = –12 mA (ERC = FAST)				
V_{OL}	LVCMOS low-level output voltage	V_{DDOx} = 2.97 V, I_{OL} = 0.1 mA (All ERC Settings)			0.1	V
		V_{DDOx} = 2.97 V, I_{OL} = 5 mA (ERC = SLOW)			0.5	V
		V_{DDOx} = 2.97 V, I_{OL} = 8 mA (ERC = MED, FAST)				
		V_{DDOx} = 2.97 V, I_{OL} = 6 mA (ERC = SLOW)			0.8	V
		V_{DDOx} = 2.97 V, I_{OL} = 10 mA (ERC = MED)				
		V_{DDOx} = 2.97 V, I_{OL} = 12 mA (ERC = FAST)				
I_{OH}	LVCMOS high-level output current	V_{DDOx} = 3.3 V, V_O = 0.5 V; T_A = 25°C		–73		mA
		V_{DDOx} = 3.3 V, V_O = 1.0 V; T_A = 25°C		–64		
		V_{DDOx} = 3.3 V, V_O = 1.65 V; T_A = 25°C		–49		
I_{OL}	LVCMOS low-level output current	V_{DDOx} = 3.3 V, V_O = 2.8 V; T_A = 25°C		78		mA
		V_{DDOx} = 3.3 V, V_O = 2.3 V; T_A = 25°C		72		
		V_{DDOx} = 3.3 V, V_O = 1.65 V; T_A = 25°C		58		
t_{PLH}, t_{PHL}	Propagation delay			5		ns
$t_{SLEW-RATE}$	Output rise/fall slew rate	ERC = Slow, 20% to 80%, f_{out} = 100 MHz, C_L = 8 pF		1.2		V/ns

8 Detailed Description

8.1 Overview

The CDCUN1208LP is a 2:8 fan-out buffer featuring a wide operating supply range, two universal differential or single-ended inputs, and universal outputs (HCSL, LVDS, or LVCMOS) with edge rate control. The clock buffer supports PCIe Gen1, Gen2, and Gen3. One of the device inputs includes a divider that provides divide values of /1, /2, /4, or /8. The device is flexible and easy to use. The state of certain pins determines device configuration at power up. Alternately, the CDCUN1208LP provides a SPI/I2C port with which a host processor controls device settings. The CDCUN1208LP delivers excellent additive jitter performance, and low power consumption. The device can run in mixed output supply mode with a dedicated supply pin for each group of outputs. This allows the device to work as an LVCMOS-level translator as well.

8.3 Feature Description

8.3.1 Device Control Using Configuration Pins

Figure 28 illustrates and Table 1 lists the CDCUN1208LP device settings using the configuration pins. Some pins sense three different states (HIGH, LOW, OPEN) according to Figure 28 and *Digital Input Electrical Characteristics – OE (SCL), INSEL, ITTP, OTTP, Divide (SDA/MOSI), ERC(ADDR/CS), Mode*. The device samples the state of the pins at power up and configures the device accordingly. Certain pins including INSEL and OE are sampled continuously; thus, changes of state of INSEL or OE control the device instantly.

Feature Description (continued)

Figure 28. CDCUN1208LP Pin Configuration Overview

Table 1. CDCUN1208LP Pin Configuration Summary

PIN NAME	PIN NUMBER	DEFINITION	DEVICE CONFIGURATION DETAILS
DEVICE OUTPUTS			
OTTP	19	Output type setting	See Table 2
ERC	31	Edge rate control	See Table 3
OE	32	Device global output enable	See Table 4
DEVICE INPUTS			
ITTP	8	Input type setting	See Table 5
DIVIDE	1	IN2 input divider control	See Table 6
INSEL	2	Input multiplexer setting	See Table 7

Product Folder Links: *CDCUN1208LP*

8.3.1.1 Configuration of Output Type (OTTP)

Table 2 shows how to set the output buffer type using the OTTP pin. This setting affects all device outputs equally. Certain combinations of output buffers include a dedicated power supply pin, which must be properly bypassed. If the device output configuration is set to LVCMOS, then the supply voltage applied establishes the switching thresholds corresponding to the supply provided according to *Clock Output Buffer Electrical Characteristics (Output Mode = LVCMOS)*. For example, if OUT1 and OUT2 are supplied with a 1.8-V power supply through the VDDO1 pin, the switching thresholds are set to the 1.8-V logic domain. The system may have other logic supplies (1.8 V, 2.5 V, or 3.3 V) connected to the device on different output buffer supply domains simultaneously. This enables the device to clock devices operating on different supplies, without the need for external logic level translation buffers. The CDCUN1208LP automatically adjusts the switching thresholds corresponding to these common logic power supply voltages. For more information regarding the power supplies for the output section, see *Device Power Supply Connections and Sequencing*.

Table 2. CDCUN1208LP Pin Configuration of Output Type

OTTP (Pin 19)	OUTPUT TYPE
LOW	LVDS
HIGH	HCSL
OPEN	LVCMOS

8.3.1.2 Configuration of Edge Rate Control (ERC)

The CDCUN1208LP supports Edge Rate Control (ERC), to tailor jitter and EMI performance from device outputs. Table 3 shows the edge rate control setting. This setting affects all device outputs equally. Each edge rate setting is unique to the output buffer type selected as described in *Clock Output Buffer Characteristics (Output Mode = LVDS)*, *Clock Output Buffer Characteristics (Output Mode = HCSL)*, and *Clock Output Buffer Electrical Characteristics (Output Mode = LVCMOS)*.

Table 3. CDCUN1208LP Pin Configuration of Output Edge Rate

ERC (Pin 31)	OUTPUT EDGE RATE
LOW	SLOW
HIGH	MEDIUM
OPEN	FAST

8.3.1.3 Control of Output Enable (OE)

Table 4 shows how the output enable pin controls the device outputs. The OE pin is sampled continuously, so that the application may turn on/off the output buffers at any time.

Table 4. CDCUN1208LP Pin Control of Output Enable

OE (Pin 32)	OUTPUT ENABLE
LOW	DISABLED in tri-state
HIGH	ENABLED
OPEN	RESERVED[1]

(1) Leaving the Output Enable pin OPEN causes the CDCUN1208LP to malfunction. This pin must be driven high or low at all times.

8.3.2 Input Ports (IN1, IN2)

8.3.2.1 *Configuration of the Input Type (ITTP)*

Table 5 describes how to set the input buffers to the appropriate switching levels using the ITTP pin. For proper input termination, see Figure 46.

Table 5. CDCUN1208LP Pin Control of Input Type (ITTP)

ITTP (Pin 8)	ITTP SETTING
LOW	LVDS
HIGH	HCSL
OPEN	LVCMOS

8.3.2.2 *Configuration of the IN2 Divider (INDIV)*

Table 6 describes how to set the input divider using the DIVIDE pin. If the /8 setting is desired, then this feature is accessed through the host configuration method only; refer to *Device Control Using the Host Interface*.

Table 6. CDCUN1208LP Pin Control of INDIV Divider

DIVIDE (Pin 1)	INDIV DIVIDER SETTING
LOW	/2
HIGH	/4
OPEN	/1

8.3.3 Smart Input Multiplexer (INMUX)

The smart multiplexer supports manual and automatic switching between IN1 and IN2. If enabled, the smart multiplexer switches automatically between clock inputs based on a prioritization scheme shown in Table 7. If using the smart multiplexer auto mode, the frequencies of the clocks applied to the smart multiplexer through IN1 and IN2 (through the divider) may differ by up to 20%. The phase relationship between clock inputs has no restrictions. The smart multiplexer includes signal conditioning that provides glitch suppression.[1]

Upon the detection of a loss of signal on the input with higher priority, the smart multiplexer switches over to the other clock input on the first incoming rising edge. During this switching operation, the output of the smart multiplexer is low. Upon restoration of the higher priority clock, the smart multiplexer waits until it detects four complete cycles from the higher priority clock prior to switching the output of the smart multiplexer back to the higher priority clock. During this switching operation, the output of the smart multiplexer remains high until the next falling edge as shown in Figure 29.

Product Folder Links: *CDCUN1208LP*

8.3.3.1 Pin Configuration of the Smart Input Multiplexer (INMUX)

Table 7 shows how to control the smart input multiplexer. In pin configuration mode, the INSEL pin is sampled continuously, so that the application may select the input clock at any time.

Table 7. Control of INMUX via the INSEL Pin

| INSEL(Pin 2)	IN1 BUFFER SETTING	IN2 BUFFER SETTING
LOW	ON and selected by INSEL multiplexer	OFF
HIGH	OFF	ON and selected by INSEL mux
OPEN	Smart multiplexer selects input. IN1 is the primary input (it has the highest priority, therefore if it is available, the smart multiplexer selects IN1)	

Figure 29. CDCUN1208LP Smart Multiplexer Operation

(1)   This implementation does not implement a phase build-out mechanism; rather, analog filtering insuring a smooth transition at device outputs.

8.4 Device Functional Modes

8.4.1 Device Control Using the Host Interface

Host configuration mode affords a greater degree of flexibility. Unlike pin configuration mode, in which the pin settings affect the entire device, host configuration mode enables the user to apply different settings to each input and output port, as depicted in Figure 30. This includes the ability to mix and match output type, edge rate control, and output enable settings. The host interface is enabled or selected by strapping the MODE pin either high (for I²C) or low (for SPI) and resetting the device. Additional device features are accessible only through the host interface as well. For instance, the user can configure the input divider (IDIV) to /8 in host configuration mode only. Additionally, the system can power down the device through device registers.

8.4.1.1 OE and INSEL in Host Configuration Mode

In host configuration mode, the OE pin is no longer available; thus buffers are controlled individually through the host interface. The input multiplexer can be controlled either through the pin or through the device registers, in accordance with Table 12.
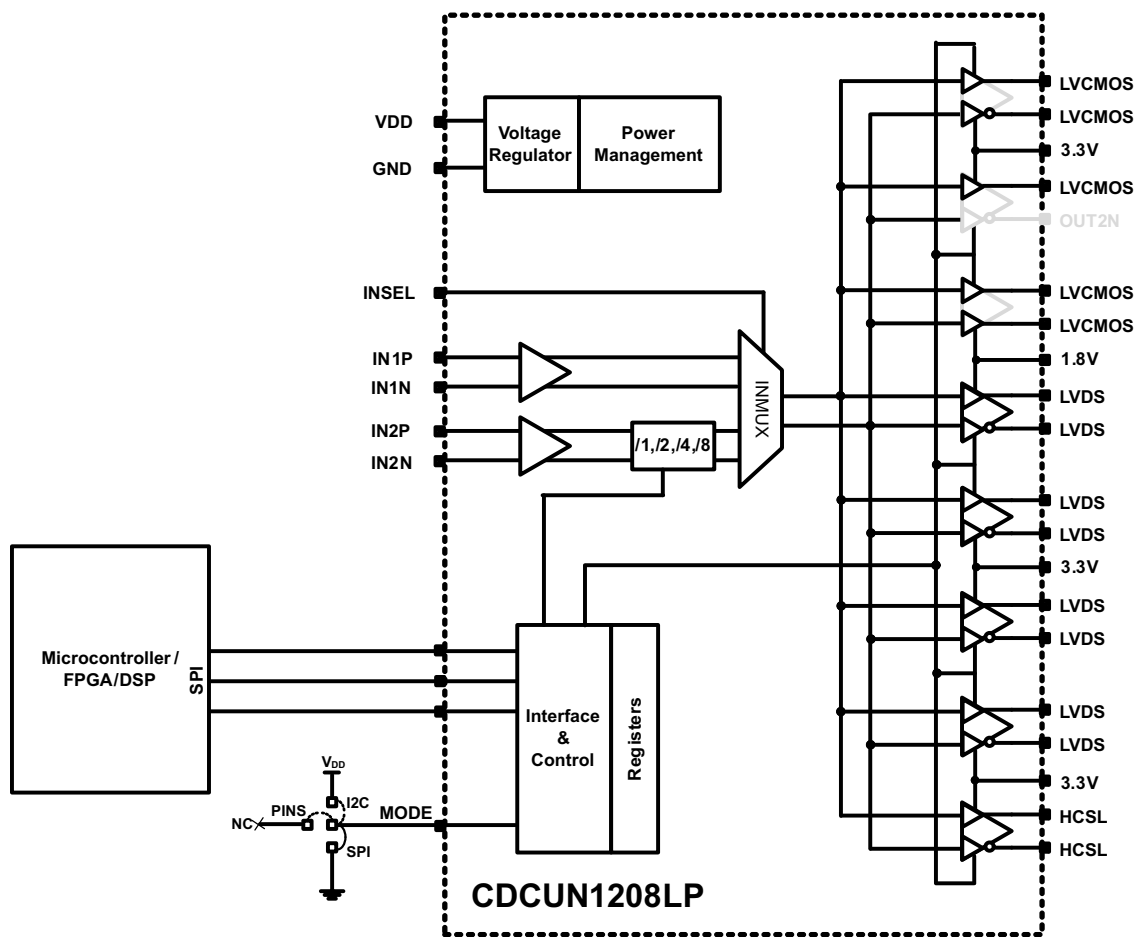

Copyright © 2017, Texas Instruments Incorporated

Figure 30. CDCUN1208LP Host Configuration – Typical Application

Product Folder Links: *CDCUN1208LP*

Device Functional Modes (continued)

When the host interface is enabled, certain pins take on alternative functions, according to Table 8.

Table 8. CDCUN1208LP Host Configuration Pins

PIN NAME IN HOST MODE	ALT PIN NAME IN PIN MODE (MODE = OPEN)	PIN NUMBER	PIN NAME IN HOST PROGRAMMING MODE (MODE/Pin 30 is tied high or low)	PIN NAME IN PIN CONFIGURATION MODE (only if MODE/Pin 30 is OPEN)
MODE		30	Programming mode 1 = I^2C, 0 = SPI, OPEN = Pins (alternative description applies)	
SDA/MOSI	DIVIDE	1	Host interface data (I^2C) / SPI Master output slave input (data In)	Input divider pin control
MISO	OTTP	19	SPI master input slave output (data out)	Output type (OTTP) pin control
SCL	OE	32	Host interface clock	Device output enable 1 = Enable, 0 = Disable
ADDR/CS	ERC	31	Host interface address (I^2C) / chip select (SPI) Pull ADDR to GND for I2C communication	Output edge rate control 1 = Fast, 0 = Slow, OPEN = Medium

The CDCUN1208LP samples the MODE pin after the device exits the power-on reset (POR) state. The device is placed in the RESET state in one of two ways: a POR circuit automatically resets the device after power is applied; or through the RESET bit (R15[1]) in register memory (see Table 12). This RESET bit is only accessible in host configuration mode. If the MODE pin (pin 11) is open (no connection), then the device is placed in the pin configuration mode and all settings are determined by the state of various pins according to Table 1 and Figure 28. If the MODE pin is low, then device enables the SPI interface; and, if MODE is high, then I^2C is enabled.

8.5 Programming

8.5.1 Host Interface Hardware Information

8.5.1.1 SPI Communication

A SPI communication link includes a master and one or more slaves (note that CDCUN1208LP supports only single-device). Table 8 lists the four signal lines that form a SPI communication link. Figure 32 shows the format for SPI messages. The SPI master (host) initiates communication by asserting SCS low. Information on SDI/SDO is latched on each rising edge of SCL. The first bit transmitted on SDI establishes the direction of the SPI transfer. Next, the master transmits the address to be written/read (up to 15 bits). If the operation is a write, the master transmits 16 data bits on SDI. If the transfer is a read, the slave transmits 16 data bits on SDO (the master continues to clock the transfer through SCL). Figure 34 and Table 9 show the timing specifications for SPI.
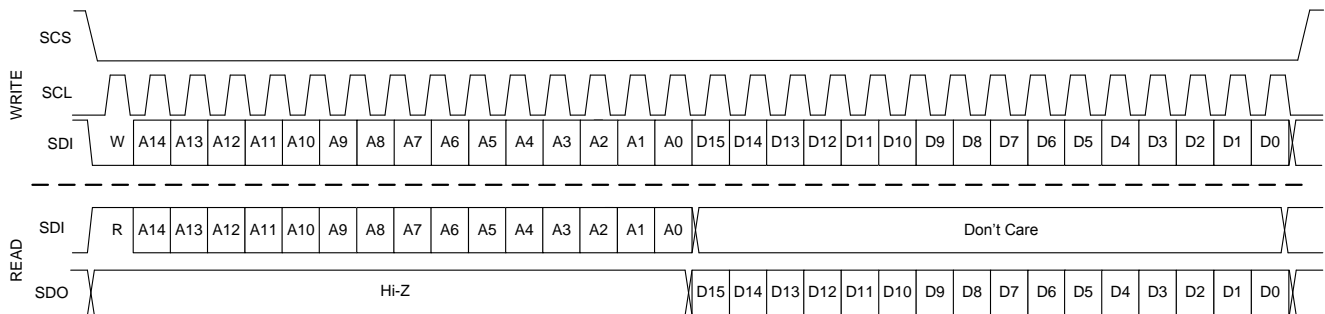

Figure 32. SPI Message Format

8.5.1.1.1 CDCUN1208LP SPI Addressing

Figure 33 shows how to construct the address field for SPI messages to and from the CDCUN1208LP. The device is assigned a 4-bit fixed address (0001b). For the host to communicate with the CDCUN1208LP, the address must include this fixed value in the correct position for the device to recognize the message.
Figure 33. CDCUN1208LP Device Addressing - SPI Mode

8.5.1.1.2 Writing to the CDCUN1208LP

To initiate a SPI data transfer, the master (host) asserts the SCS (serial chip select) pin low (see Figure 32). The first rising edge of the clock signal (SCL) transfers the bit presented on the SDI pin of the CDCUN1208LP. This bit signals if a read (first bit high) or a write (first bit low) will transpire. The master shifts data to the slave with each rising edge of SCL. Following the W/R bit are 4 fixed bits followed by 11 bits that specify the address of the target register in the register file (see Figure 33). The 16 bits that follow are the data payload. If the master sends

Programming (continued)

an incomplete message, (that is, the master de-asserts the SCS pin high prior to a complete message transmission), then the slave aborts the transfer, and device makes no changes to the register file or the hardware. The master signals the slave of the completed transfer and disables the SPI port by de-asserting the SCS pin high. At no time should the clock be toggled while SCS is high. CDCUN1208LP should always be used in single-slave SPI configuration.

8.5.1.1.3 Reading From the CDCUN1208LP

As with the write operation, the master first initiates a SPI transfer by asserting the SCS pin low. The host signals a read operation by shifting a logical high in the first bit position, signaling the slave that the master is initiating a read data transfer from the slave. Thereafter, the master specifies the address of interest according to Figure 33. During the 16 clock cycles that follow, the slave presents the data from the register specified in the first half of the message on the SDO pin. The master signals the slave that the transfer is complete by de-asserting the SCS pin high. At no time should the clock be toggled while SCS is high. CDCUN1208LP should always be used in single-slave SPI configuration.

8.5.1.1.4 Block Write/Read Operation

The CDCUN1208LP supports a block write and block read operation. The master need only specify the lowest address of the sequence of addresses that the host needs to access. The CDCUN1208LP automatically increments the internal register address pointer if the SCS pin remains active low after the SPI port finishes the initial 32-bit transmission sequence. Each transmission of 16 bits (a data payload width) results in the slave automatically incrementing the address pointer (provided the SCS pin remains active low for all sequences).

Figure 34. SPI Timing Diagram

Programming (continued)

Table 9. SPI Timing Specifications

PARAMETER		MIN	TYP	MAX	UNIT
f_{Clock}	Clock frequency for the SCL			20	MHz
t_1	SCS to SCL setup time	10			ns
t_2	SDI to SCL setup time	10			ns
t_3	SDI to SCL hold time	10			ns
t_4	SCL high duration	25			ns
t_5	SCL low duration	25			ns
t_6	SCL to SDO Setup time	10			ns
t_7	SCS pulse width	20			ns
t_8	SCL falling edge to SCS release time	10			ns

8.5.1.2 I^2C Communication

The CDCUN1208LP incorporates an I^2C port compliant with I^2C Bus Specification V2.1 (7-bit addressing). Some highlights are contained herein to provide clarity with respect to how communication between the host and the CDCUN1208LP is facilitated. The I^2C bus comprises two signals (clock – SCL, and data – SDA). I^2C implements a master-slave protocol and supports multi-master implementations. Unlike SPI that implements a chip select signal for device-level addressing and separate data signals for transmit and receive, I^2C embeds the device address in the serial data stream. Because of this, devices that reside on the I^2C must have a unique bus address. I^2C also uses the protocol to control the direction of data flow through the data signaling line.

8.5.1.2.1 Message Transmission

8.5.1.2.1.1 Data and Address Bits

When transmitting address or data bits, the transmitter must only change the state of SDA when SCL is low. During the time that SCL is high, SDA must be stable (no transitions).
Figure 35. I²C Data/Address Bit Transmission

8.5.1.2.1.2 Special Symbols – Start (S) and Stop (P)

Messages are framed by the master by generating a START and a STOP symbol. The START symbol is signaled by transitioning the SDA line from high to low while the SCL line is high. The STOP symbol is signaled by transitioning the SDA line from low to high while the SCL line is high.
Figure 36. I²C Bus START and STOP Symbol Generation

8.5.1.2.1.3 Special Symbols – Acknowledge (ACK)

The acknowledge symbol must be sent by the receiver during the 9th clock cycle after the transmitter sends a byte of data. The transmitter allows the SDA pin to go high, and the receiver pulls the line low to acknowledge the receipt of the byte (leaving the SDA high indicates that the byte was not received). If this occurs the transmitter issues a STOP and retransmits the message. If the receiver is not prepared to receive another byte, it can suspend transmission by holding the SDA line low during the ACK time slot. When the receiver is ready to receive another byte, it releases the SDA line.

8.5.1.2.1.4 Generic Message Frame

Figure 37 shows a typical format for I²C messages. The message frame is bracketed by the START and STOP symbols (both generated by the master). If a START symbol has not been transmitted, then the bus is considered 'available'. If a START symbol has been transmitted and a STOP symbol has not been transmitted, the bus is considered 'busy'. The first 8 bits transmitted include the R/W bit and a 7-bit I²C address field. The reception of each byte grouping that is transmitted must be acknowledged by the receiver. Next, the high byte of the data pay load is transmitted (MSB first) followed by an acknowledgment by the receiver. Finally, the low byte is sent. After acknowledgment, the master sends a STOP symbol to end the message frame.
Figure 37. I²C Message Format

8.5.1.2.1.5 CDCUN1208LP Message Format

Figure 38 shows the format of addressing and flow control for I²C messages to and from the CDCUN1208LP. A message includes two address fields. The I²C address is used to support multiple devices on the bus (each device must have a unique I²C address). The register address specifies which register of the device identified by the I²C address is to be written/read.
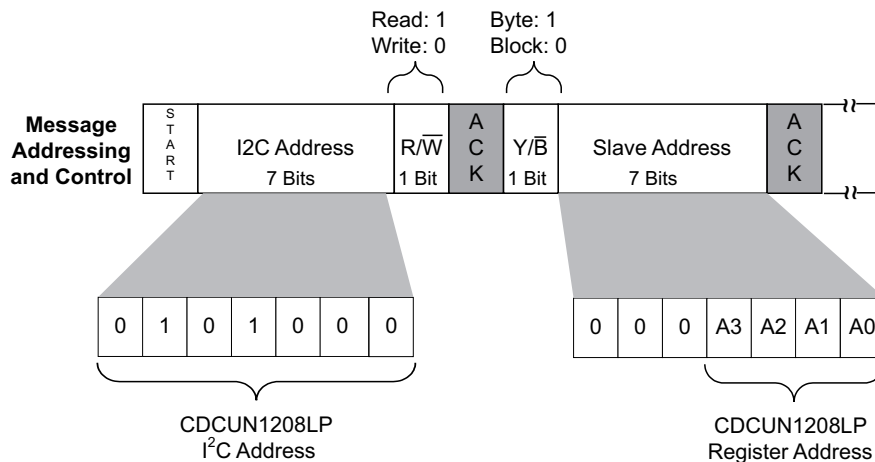

Figure 38. CDCUN1208LP I²C Message - Addressing

8.5.1.2.1.6 CDCUN1208LP Device Addressing (I²C Address)

Figure 38 outlines the construction of the I²C address shown in Figure 37. The I²C address is set to 7b'0101000, or 0x28. The ADDR pin must be pulled to ground. The next 8 bits transmitted is called the register address.

Product Folder Links: *CDCUN1208LP*

8.5.1.2.1.7 CDCUN1208LP Device Addressing (Register Address)

Figure 38 shows the format of the register address field of the I2C message. The first bit determines if the transfer is a byte or a block (more than one byte). The CDCUN1208LP register width is 16 bits (2 bytes), therefore, generally block addressing is used to access each register in its entirety. Because the I2C protocol requires that the slave address is a 7-bit field, the leading 3-bits are all '0' while the trailing 4-bits specify the device register of interest.

8.5.1.2.2 I2C Master and Slave Handshaking

Figure 39 shows the handshaking between the master (host) and the slave (CDCUN1208LP) that the I2C protocol supports. In all cases, the master drives the SCL (clock line); however, depending on the direction of transfer/acknowledgment, the master or the slave device drives SDA (data line).
Figure 39. I2C Master and Slave Handshaking Example

8.5.1.2.3 Block Read/Write

For block write/read operations, the bytes are accessed in sequential order from lowest to highest byte (with most significant bit first), with the ability to stop after any complete byte has been transferred. The start address of the transfer is specified in the same way a single word transfer is initiated.

(1)   When configuring device inputs as LVCMOS, apply the single-ended clock signal to INxP and leave INxN either floating or ground it. The power supply voltage (1.8 V, 2.5 V, or 3.3 V) applied to V_{DD} (pin 5) establishes the switching thresholds for IN1 and IN2 in LVCMOS mode.

9   Application and Implementation

> **NOTE**
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1   Application Information

The CDCUN1208LP is a low additive jitter, 2:8 fan-out buffer with universal inputs and outputs. The low-power consumption, low output skew, and low additive jitter make for a flexible device in demanding applications.

9.2   Typical Application

9.2.1   PCI Express Applications

Texas Instruments offers a complete clock solution for PCI Express applications. The CDCUN1208LP can be used to fan out the 100-MHz clock signal provided by the CDCM9102 as depicted in Figure 41.
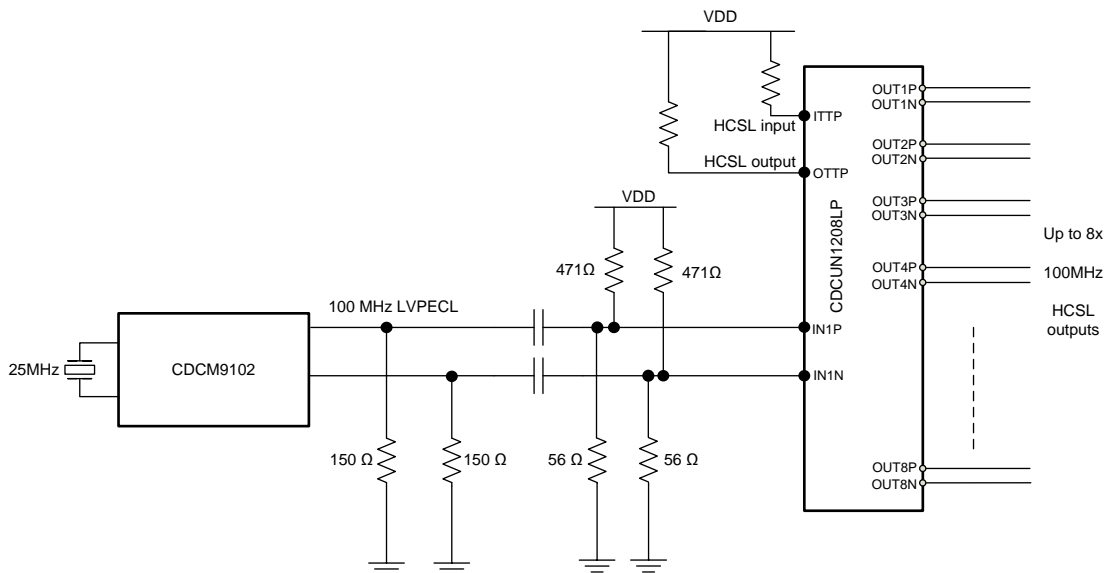

Copyright © 2017, Texas Instruments Incorporated

Figure 41. Clock Solution for PCIe Express Applications

9.2.1.1   Design Requirements

For this design example, use the parameters shown in Table 13.

Table 13. Design Parameters

PARAMETER	VALUE
$f_{IN1,2}$	Input single ended frequency of at least 800 kHz and at most 250 MHz.
f_{INDIFF}	Input differential frequency of at least 800 kHz and at most 400 MHz (here 100 MHz).
$\Delta V/\Delta T$ Input edge rate	Input slew rate of at least 0.75 V/ns.

9.2.1.2 Detailed Design Procedure

The CDCUN1208LP is a easy-to-use device. The user determines the following parameters in order:

In control mode:
- Pin control mode or SPI mode (host interface) : this is done by externally pulling up or pulling down the MODE pin.

In pin control mode:
- The input type, optional input divider ratio and input multiplexer selection should be set.
- The output type, optional output edge rate control, and output enable should be set. This is described in detail in Device Control Using Configuration Pins.

In host control mode:
- SPI interface should be connected to the host (only one CDCUN1208LP device can be connected to the bus).
- Communication should follow the procedure described in Device Control Using the Host Interface.
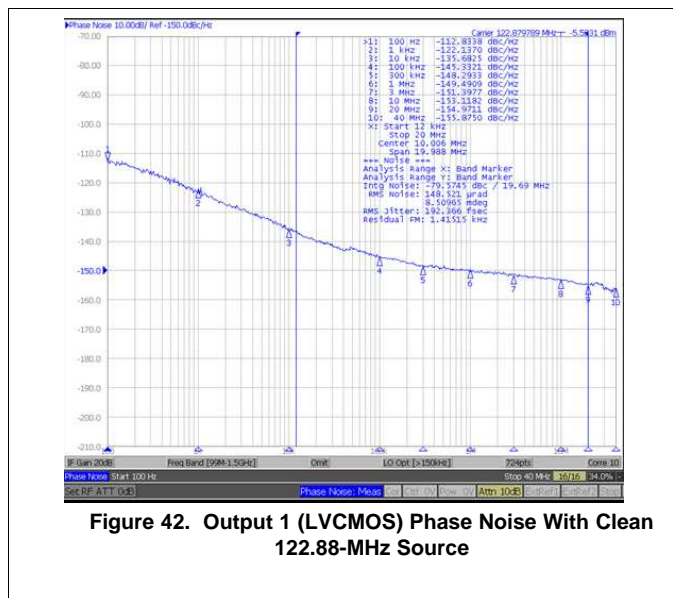

9.2.1.3 Application Curves

Figure 42. Output 1 (LVCMOS) Phase Noise With Clean 122.88-MHz Source

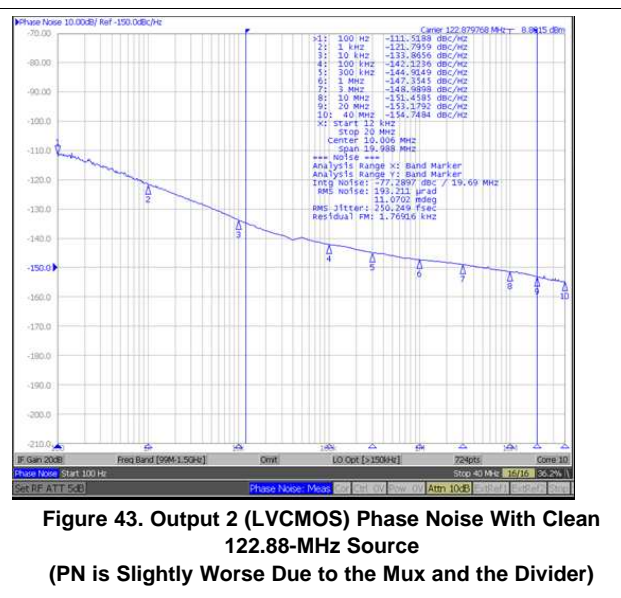

Figure 43. Output 2 (LVCMOS) Phase Noise With Clean 122.88-MHz Source
(PN is Slightly Worse Due to the Mux and the Divider)

9.3 Systems Examples

Figure 44 shows a typical application in which the receiver is off-board. The PCIe Specification (CEM2.0) requires that all source termination is on the motherboard (not on the daughter card). For this reason, the termination resistors are placed as shown. Additionally, source resistors are employed to eliminate ringing. In this case, Z_L can vary between 40 Ω and 60 Ω and R_S can range from 22 Ω to 33 Ω.
Copyright © 2017, Texas Instruments Incorporated

Figure 44. Typical Configuration – Off-Board Receiver

Figure 45 shows a typical application in which the receiver is on-board. In this case, series resistors are not required to eliminate ringing as proper termination is achieved. In this case, two termination resistors, Z_L = 49.9 Ω, are placed close to the receiver.

10 Power Supply Recommendations

10.1 CDCUN1208LP Power Consumption

Table 14. CDCUN1208LP Power Consumption (T_A = –40°C to 85°C)

PARAMETER	DEVICE SETTINGS (See Table 1)[1]							TEST CONFIGURATION	DESCRIPTION	MAX CURRENT V_{DD}= 1.8V f_{OUT} = f_{in} = 100 MHz	MAX CURRENT V_{DD} = 3.3V f_{OUT} = f_{in} = 100MHz	UNIT
	MODE	OE	ERC	OTTP	INSEL	ITTP	PD Bit					
$I_{PD1.8,3.3}$	L or H	L	X	X	X	L	H	Host configuration mode (see Host Configuration Mode)	Device power down	3	4	mA
$I_{CORE1.8,3.3}$	O	L	X	X	X	L	X	Figure 25a,b,c	Device outputs off	26	35	mA
$I_{HCSL1.8,3.3}$	O	H	O	H	L	O	X	Figure 25a	HCSL buffer current consumption[2]	23	23	mA
$I_{LVDS1.8,3.3}$	O	H	O	L	L	O	X	Figure 25b	LVDS buffer current consumption[2]	9	9	mA
$I_{LVCMOS1.8,3.3}$	O	H	O	O	L	O	X	Figure 25c	LVCMOS buffer current consumption (one side)[2]	8	11	mA
$I_{DEV-HCSL1.8,3.3}$	O	H	O	H	L	O	X	Figure 25a	Device current consumption – HCSL mode	200	200	mA
$I_{DEV-LVDS1.8,3.3}$	O	H	O	L	L	O	X	Figure 25b	Device current consumption – LVDS mode	80	90	mA
$I_{DEV-LVCMOS1.8,3.3}$	O	H	O	O	L	O	X	Figure 25c	Device current consumption – LVCMOS mode	130	210	mA

(1) H = input high, L = input low; O = input open
(2) Buffer current consumption values represent the average of the current drawn by V_{DDO1}, V_{DDO2}, V_{DDO3}, and V_{DDO4}, divided by 8 (differential mode) or 16 (single-ended mode).

### 10.2 Device Power Supply Connections and Sequencing

VDD (pin 5) is the core power supply of the device while VDDOx (pins 11, 14, 22, and 27) provide power for the output sections. The core supply must be present either before the application of the output power supplies or be present simultaneously. Applying an output power supply voltage on any of the VDDOx pins prior to the application of power to the core supply pin potentially results in improper device operation.

VDDO2 (pin 14) and VDDO4 (pin 27) provide power for OUT1/OUT2 and OUT7/OUT8, respectively. Additionally, these pins provide power to integrated voltage regulators that condition power for two banks of outputs. For example, the regulator associated with OUT1–OUT4 receives power from the VDDO2 pin. Consequently, if the application requires one or two outputs from a bank of four, then the application must use OUT3/OUT4 and apply power through VDDO2 [1]. Likewise, the regulator that conditions power for OUT5–OUT8 receives power from VDDO4 (pin 27). If the application uses subset of OUT5–OUT8, then OUT7/OUT8 must be used. For example, if the application uses 6 of the 8 output channels, then VDDO1, VDDO2, and VDDO4 (along with OUT1–OUT4, and OUT7–OUT8) must be used. If the application requires the use of 7 of the 8 output channels, the VDDO1–VDDO4 are used, and OUT1–OUT7 or OUT1–OUT6 and OUT8 could be used.

(1) If OUT1 or OUT2 are used and VDDO1 is powered but not VDDO2, the CDCUN1208LP will not function properly. Likewise, if OUT5 or OUT6 are used and VDDO3 is powered but not VDDO4, then the device will not function properly either.

10.3 Device Inputs (IN1, IN2)

Figure 46 shows how to interface certain common signaling formats to the device inputs of the CDCUN1208LP. This entails both proper signal termination as well as input buffer configuration through the input type (ITTP) pin.

11 Layout

11.1 Layout Guidelines

- Keep the connections between the bypass capacitors and the power supply on the device as short as possible.
- Ground the other side of the capacitor using a low impedance connection to the ground plane.
- If the capacitors are mounted on the back side, 0402 components can be employed.
- For component side mounting, use 0201 body size capacitors to facilitate signal routing.
- Use a matrix of ground vias to connect the thermal pad to the ground layer.
11.2 Layout Example

Figure 47. Example Layout

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
CDCUN1208LPRHBR	ACTIVE	VQFN	RHB	32	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	UN 1208LP	Samples
CDCUN1208LPRHBT	ACTIVE	VQFN	RHB	32	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	UN 1208LP	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
