## 9.8V LOW POWER PRECISION REFERENCE SOURCE

---

### DESCRIPTION

The ZRT100 is a monolithic integrated circuit providing a precise stable reference voltage of 9.8V at 500 $\mu$ A.

The circuit features a knee current of 150 $\mu$ A and operation over a wide range of temperatures and currents.

The ZRT100 is available in a SOT223 package for surface mount applications. This device offers a trim facility whereby the output voltage can be adjusted as shown in Fig.1. This facility is used when compensating for system errors or setting the reference output to a particular value. When the trim facility is not used, the pin should be left open circuit.

### FEATURES

- Trimmable output
- Excellent temperature stability
- Low output noise figure
- Available in two temperature ranges
- 1 and 2% initial voltage tolerance versions available
- No external stabilising capacitor required in most cases
- Low slope resistance
- SOT223 small outline package

## TYPICAL CHARACTERISTICS

### NOTES:

#### (a) Output change with temperature

The absolute maximum difference between the maximum output voltage and the minimum output voltage over the specified temperature range:

$$\Delta V_R = V_{max} - V_{min}$$

#### (b) Output temperature coefficient ( $T_C V_R$ )

The ratio of the output change with temperature to the specified temperature range expressed in ppm/ $^{\circ}$ C:

$$T_C V_R = \frac{\Delta V_R \times 10^6}{V_R \times \Delta T} \text{ ppm}^{\circ}\text{C}$$

$\Delta T$  = Full temperature range

#### (c) Operating current ( $I_r$ )

Maximum operating current must be derated as indicated in maximum ratings.

#### (d) Slope resistance ( $R_s$ )

The slope resistance is defined as:

$$R_s = \frac{\text{change in } V_R}{\text{specific current range}}$$

$$\Delta I = 5 - 0.5 = 4.5 \text{ mA (typically)}$$

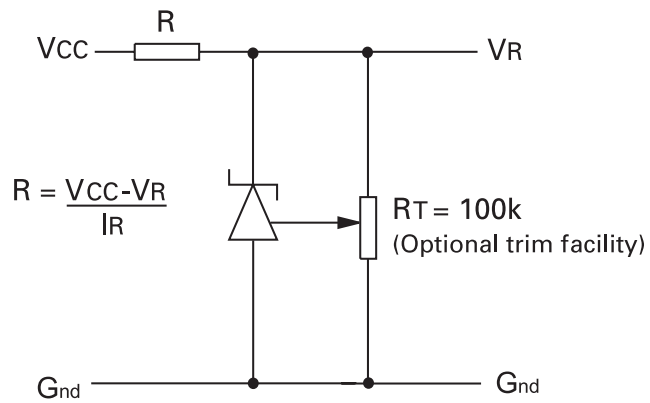

#### (e) Line regulation

The ratio of change in output voltage to the change in input voltage producing it:

$$\frac{R_s \times 100}{V_R \times R_{SOURCE}} \% / V$$
