Table 10-1. CAMSS I/O Description

Signal Name	I/O ⁽¹⁾	Description
csi2_0_dx0	I	Serial CSI2 mode: Differential clock lane positive input
csi2_0_dy0	I	Serial CSI2 mode: Differential clock lane negative input
csi2_0_dx1	I	Serial CSI2 mode: Differential data lane positive input
csi2_0_dy1	I	Serial CSI2 mode: Differential data lane negative input
csi2_0_dx2	I	Serial CSI2 mode: Differential data lane positive input
csi2_0_dy2	I	Serial CSI2 mode: Differential data lane negative input

⁽¹⁾ I = Input; O = Output

Table 10-1. CAMSS I/O Description (continued)

Signal Name	I/O ⁽¹⁾	Description
csi2_0_dx3	I	Serial CSI2 mode: Differential data lane positive input
csi2_0_dy3	I	Serial CSI2 mode: Differential data lane negative input
csi2_0_dx4	I	Serial CSI2 mode: Differential data lane positive input
csi2_0_dy4	I	Serial CSI2 mode: Differential data lane negative input
csi2_1_dx0	I	Serial CSI2 mode: Differential clock lane positive input
csi2_1_dy0	I	Serial CSI2 mode: Differential clock lane negative input
csi2_1_dx1	I	Serial CSI2 mode: Differential data lane positive input
csi2_1_dy1	I	Serial CSI2 mode: Differential data lane negative input
csi2_1_dx2	I	Serial CSI2 mode: Differential data lane positive input
csi2_1_dy2	I	Serial CSI2 mode: Differential data lane negative input

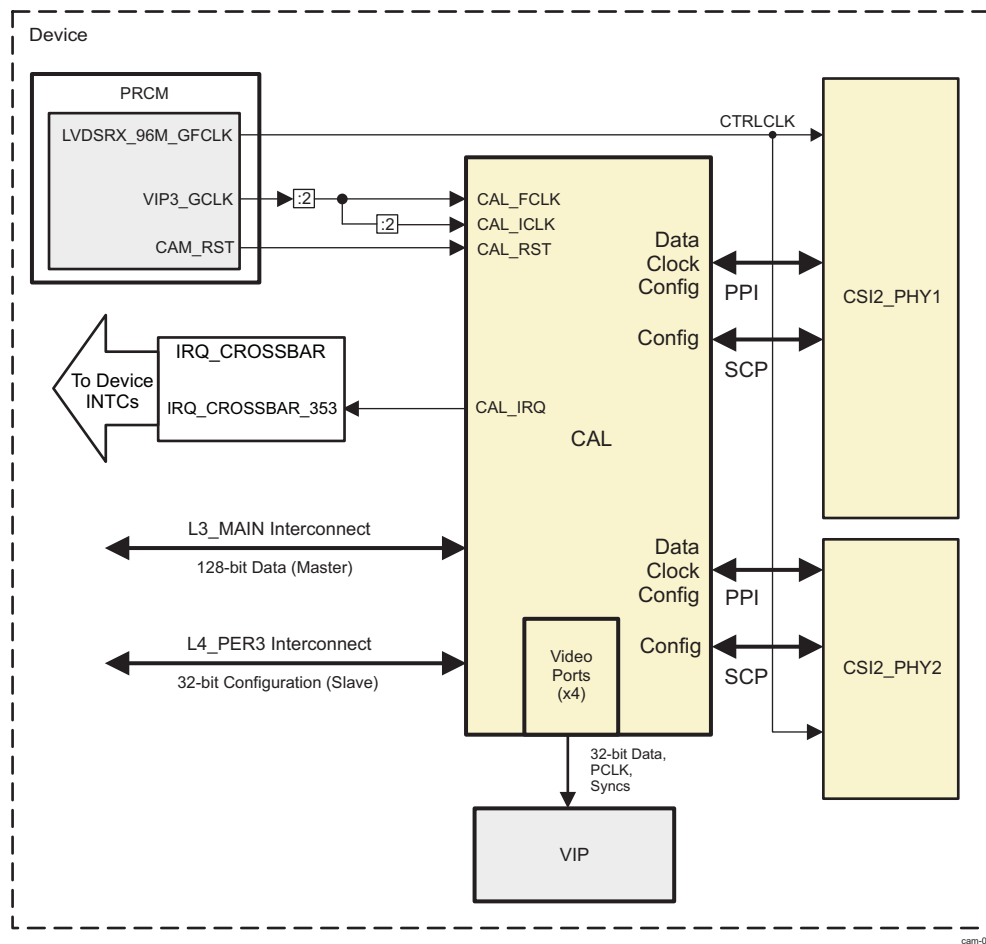

NOTE: The *Description* column in [Table 10-1](#) shows only the default function (data or clock lane) of each CSI2 differential pair. Refer to [Section 10.4.5, CSI2 PHY Functional Description](#), for more details on configurations available.

10.3 CAMSS Integration

NOTE: CAL and CSI2_PHY support is device part number dependent. Refer to a device-specific Data Manual, for more information.

This section describes the integration of CAMSS in the device, including information about clocks, resets, and hardware requests.

Figure 10-3. CAMSS Integration

NOTE: For more information about the slave idle protocol, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

10.3.1 CAMSS Main Integration Attributes

This section describes the CAMSS integration in the device, including information about clocks, resets, and hardware requests.

[Table 10-2](#) through [Table 10-4](#) summarize the integration of the module in the device.

Table 10-2. CAL Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
CAL	PD_COREAON PD_CAM ⁽¹⁾	No	L3_MAIN for data transfers to system memory; L4_PER3 for configuration

⁽¹⁾ CAL module is placed in PD_COREAON but its clocks and resets controls are associated with PD_CAM. In order to use the CAL module, PD_CAM needs to be turned on. For more information on the power domains, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 10-3. CAMSS Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
CAL	CAL_FCLK	VIP3_GCLK	PRCM	Functional clock.
	CAL_ICLK	VIP3_GCLK / 2	PRCM	Configuration clock on L4_PER3 interconnect (OCPC port). Equal to 1/2 of the CAL_FLCK.
	CAL_BYTECLKHS	RXBYTECLKHS	CSI2 PHY	CSI2 High-Speed Receive Byte Clock.
CSI2_PHY1 and CSI2_PHY2	CTRLCLK	LVDSRX_96M_GFCLK	PRCM	Control clock for CSI2 PHY modules.
	SCPCLK	CAL_SCPCLK	CAL	Configuration clock for CSI2 PHY modules. Equal to 1/4 of CAL_FLCK.
	PWRCLK	CAL_PWRCLK	CAL	Power management clock for CSI2 PHY modules. Equal to 1/4 of CAL_FLCK.
-	-	VP_PCLK	CAL	Pixel clock provided on the CAL output video port(s). For more information, see Section 10.3.2, CAL Integration - Video Port .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
CAL	CAL_RST	CAM_RST	PRCM	CAL global hardware reset

Table 10-4. CAL Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
CAL	CAL_IRQ	IRQ_CROSSBAR_353	N/A	CAL interrupt request

NOTE: The “Default Mapping” column in [Table 10-4 CAL Hardware Requests](#) shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module. For more information about the IRQ_CROSSBAR module, see [Section 20.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 20, Control Module](#). For more information about the device interrupt controllers, see [Chapter 19, Interrupt Controllers](#).

10.3.2 CAL Integration - Video Port

CAL has two modes for video port operation: baseline mode and VPx4 mode.

- The baseline mode can be selected by setting CTRL_CORE_SMA_SW_3[31] CAL_BASELINE_EN register bit to 1 from RESET onwards. In baseline mode only Video Port 1 is active. The CTRL_CORE_SMA_SW_3 register is located in device Control Module, see [Chapter 20](#).
- In VPx4 mode, CAL provides four identical video ports. The VPx4 mode (default) is selected when

CAL_BASELINE_EN register bit is set to 0. All four video ports follow the same programming with the exception of CPORT. For more information, see [Section 10.4.6.9, CAL Video Port](#).

The video ports can be used for data transfer to the device VIP modules. The mapping of CAL video ports signals to VIP modules is controlled via registers in the device Control Module. For more information, see [Section 11.2, VIP Environment](#).

[Table 10-5](#) summarizes the video port interface signals (descriptions apply to all four video ports).

Table 10-5. CAL Video Port Signals

Signal name ⁽¹⁾	I/O	Description
VPn_PCLK	O	Output pixel clock. Synchronous to the functional clock. Mean clock rate defined by the CAL_VPORT_CTRL1[16:0] PCLK register bit-field.
VPn_VS	O	Active during the first pixel of the frame.
VPn_VE	O	Active during the last pixel of the frame.
VPn_HS	O	Active during the first pixel of any line.
VPn_HE	O	Active during the last pixel of any line.
VPn_DATA[15:0]	O	When CAL_VPORT_CTRL1[31] WIDTH = 0: Pixel data for any position When CAL_VPORT_CTRL1[31] WIDTH = 1: Pixel data for position (X%2) = 0 MSBs are padded with 0s when less than 16 bits are used.
VPn_DATA[31:16]	O	When CAL_VPORT_CTRL1[31] WIDTH = 0: Stuffed with 0s for any position When CAL_VPORT_CTRL1[31] WIDTH = 1: Pixel data for position (X%2) = 1 MSBs are padded with 0s when less than 16 bits are used.
VPn_STALL	I	Hardwired to 0. The video port cannot be stalled from outside CAL.

⁽¹⁾ n = 1 through 4 (video port number)

Software can control the minimum time between two consecutive VP_PCLK pulses using the [CAL_VPORT_CTRL1\[16:0\]](#) PCLK bit field. It can also impose minimum vertical and horizontal blanking using the [CAL_VPORT_CTRL1\[24:17\]](#) XBLK and [CAL_VPORT_CTRL1\[30:25\]](#) YBLK bit fields.

The video port can carry up to 2 pixels per VP_PCLK clock cycle.

For more details on the video port, see [Section 10.4.6.9, CAL Video Port](#).

10.3.3 CAL Integration - PPI Interface

CAL does not connect directly to an image sensor but to a complex I/O (CSI2 PHY). CAL can connect to up to two CSI2 complex I/Os through PHY Protocol Interfaces (PPI) which can be used simultaneously. For more details on the PPI interface configuration, refer to [Section 10.4.5, CSI2 PHY Functional Description](#), and [Section 10.4.6.2.1, CSI2 Physical Layer](#).

10.4 CAMSS Functional Description

NOTE: CAL and CSI2_PHY support is device part number dependent. Refer to a device-specific Data Manual, for more information.

10.4.1 CAMSS Hardware and Software Reset

An active low asynchronous hardware reset is provided by the PRCM. It is internally resynchronized to the functional clock domain.

A software reset is triggered by setting the [CAL_HL_SYSCONFIG\[0\] SOFTRESET](#) bit to 0x1. The CAL hardware ensures that the software reset is performed on clean OCP transactions boundaries and that no OCP protocol violation can occur due to the software reset. Mainly, it finishes ongoing OCP transactions and prevents generation of new ones.

The [CAL_HL_SYSCONFIG\[0\] SOFTRESET](#) bit is automatically cleared by hardware when the software reset has completed. The software reset will never complete, if outstanding OCP responses are not returned. This situation is only expected when the slave with which CAL is communicating fails. A hardware reset is reset in that case.

A software reset is faster than a hardware reset controlled by the device PRCM module. In fact, to avoid OCP protocol violations, the PRCM module first puts the CAL into Idle mode. The PRCM can only perform a clean hardware reset once CAL has acknowledged the IDLE request. That only happens once the CAL has flushed all pending traffic. A software reset simply waits for the next clean OCP transaction boundary without finishing the frame.

OCPC is fully functional after a software reset.

10.4.2 CAMSS Clock Configuration

CAL receives one functional clock (CAL_FLCK) from PRCM that is also used for the OCP ports. The configuration port (OCPC) operates at half the functional clock speed (clock enable signal used).

In addition, CAL receives one asynchronous clock for each PPI interface. This clock is generated from the bit clock received from the image sensor and converted into a byte clock (CAL_BYTECLKHS) by the connected CSI2 PHY.

CAL also provides the PWRSCP clock used to configure the CSI2 PHY. It is equal to the CAL functional clock divided by 4 (CAL_FLCK / 4) and is gated depending on the functional needs.

10.4.3 CAMSS Power Management

CAL supports a IDLE protocol interface. It is used to ensure that the CAL clock / power can only be cut where there are no pending transactions. It is also used to ensure that CAL generates no more traffic before gating the functional clock. The PRCM sends an IDLE request to CAL when the software requests CAL shutdown.

When CAL receives an IDLE request, it performs the following actions:

1. Finishes pending transactions:
 - a. All data has been flushed out from the write buffer.
 - b. FE short packet has been received (but no new FS) on all enabled PPI virtual channels.
2. Disconnects the OCPC and OCPO ports on clean transaction boundaries.
3. Acknowledges the IDLE request.

On CAL level the IDLE protocol configuration is controlled via [CAL_HL_SYSCONFIG\[3:2\] IDLEMODE](#) register bit-field. For more information on CAL clock and power management on device level, see [Section 3.6.4.24, CD_CAM Clock Domain](#) and [PD_CAM Description](#) in [Chapter 3, Power, Reset, and Clock Management](#).

For more information on CSI2 PHY power management, refer to [Section 10.4.5.2, CSI2 PHY Configuration](#).

10.4.4 CAMSS Interrupt Events

This section describes the interrupt events that can trigger the CAL_IRQ signal (see also [Section 10.3.1, CAL Main Integration Attributes](#)).

NOTE: The CAL does not provide an event to detect Attribute Payload data at low level protocol level. Attribute data can only be sent to memory and therefore software can use the IRQ_WDMA_START / END events detected by the Write DMA block.

Table 10-6 lists the event generation and corresponding registers of the CSI2 Low Level Protocol engines.

Table 10-6. CSI2 Low Level Protocol Interrupts

Event and Register	Description
CAL_CSI2_COMPLEXIO_IRQENABLE_I [27] FIFO_OVF_IRQ	FIFO overflow error: This interrupt is triggered when a FIFO overflow is detected. An overflow can occur if there is a mismatch between the data input and output rates. In case of an overflow the module properly finishes the burst that has been started and does not issue any new OCP transactions on the master port. A reset of the module is required to restart correctly.
CAL_CSI2_COMPLEXIO_IRQENABLE_I [28] SHORT_PACKET_IRQ	Short packet reception (other than sync events: line start, line end, frame start, and frame end; only data types from 0x8 to 0xF are considered)
CAL_CSI2_COMPLEXIO_IRQENABLE_I [30] ECC_NO_CORRECTION_IRQ	ECC was not used to correct the header because the error is larger than 1 bit (short and long packets).
CAL_CSI2_VC_IRQENABLE_I [x] ECC_CORRECTION_IRQ_x, where x = [0...3]	ECC was used to correct a 1-bit error (short packet only).
CAL_CSI2_VC_IRQENABLE_I [x] FS_IRQ_x, where x = [0...3]	Frame start: This interrupt is triggered when a frame-start synchronization code is detected in the CSI2 data stream.
CAL_CSI2_VC_IRQENABLE_I [x] FE_IRQ_x, where x = [0...3]	Frame end: This interrupt is triggered when a frame-end synchronization code is detected in the CSI2 data stream.
CAL_CSI2_VC_IRQENABLE_I [x] LS_IRQ_x, where x = [0...3]	Line start: This interrupt is triggered when a line-start synchronization code is detected in the CSI2 data stream.
CAL_CSI2_VC_IRQENABLE_I [x] LE_IRQ_x, where x = [0...3]	Line end: This interrupt is triggered when a line-end synchronization code is detected in the CSI2 data stream.
CAL_CSI2_VC_IRQENABLE_I [x] CS_IRQ_x, where x = [0...3]	CS error: This interrupt is triggered when a mismatch between the transmitter and receiver checksums (payload) is detected.

Table 10-7 lists CSI2 Complex I/O event generation. The events are checked and controlled from the [CAL_CSI2_COMPLEXIO_IRQSTATUS_I](#) and [CAL_CSI2_COMPLEXIO_IRQENABLE_I](#) registers.

Table 10-7. CSI2 Complex I/O Interrupts

Event and Register	Description
CAL_CSI2_COMPLEXIO_IRQENABLE_I [0] ERRSOTHS1	Start of transmission error for lane 1
CAL_CSI2_COMPLEXIO_IRQENABLE_I [1] ERRSOTHS2	Start of transmission error for lane 2
CAL_CSI2_COMPLEXIO_IRQENABLE_I [2] ERRSOTHS3	Start of transmission error for lane 3
CAL_CSI2_COMPLEXIO_IRQENABLE_I [3] ERRSOTHS3	Start of transmission error for lane 4
CAL_CSI2_COMPLEXIO_IRQENABLE_I [4] ERRSOTHS3	Start of transmission error for lane 5
CAL_CSI2_COMPLEXIO_IRQENABLE_I [5] ERRSOTSYNCHS1	Start of transmission sync error for lane 1
CAL_CSI2_COMPLEXIO_IRQENABLE_I [6] ERRSOTSYNCHS2	Start of transmission sync error for lane 2
CAL_CSI2_COMPLEXIO_IRQENABLE_I [7] ERRSOTSYNCHS3	Start of transmission sync error for lane 3
CAL_CSI2_COMPLEXIO_IRQENABLE_I [8] ERRSOTSYNCHS3	Start of transmission sync error for lane 4
CAL_CSI2_COMPLEXIO_IRQENABLE_I [9] ERRSOTSYNCHS3	Start of transmission sync error for lane 5
CAL_CSI2_COMPLEXIO_IRQENABLE_I [10] ERRESC1	Escape entry error for lane 1

Table 10-7. CSI2 Complex I/O Interrupts (continued)

Event and Register	Description
CAL_CSI2_COMPLEXIO_IRQENABLE_I[11] ERRESC2	Escape entry error for lane 2
CAL_CSI2_COMPLEXIO_IRQENABLE_I[12] ERRESC3	Escape entry error for lane 3
CAL_CSI2_COMPLEXIO_IRQENABLE_I[13] ERRESC4	Escape entry error for lane 4
CAL_CSI2_COMPLEXIO_IRQENABLE_I[14] ERRESC5	Escape entry error for lane 5
CAL_CSI2_COMPLEXIO_IRQENABLE_I[15] ERRCONTROL1	Control error for lane 1
CAL_CSI2_COMPLEXIO_IRQENABLE_I[16] ERRCONTROL2	Control error for lane 2
CAL_CSI2_COMPLEXIO_IRQENABLE_I[17] ERRCONTROL3	Control error for lane 3
CAL_CSI2_COMPLEXIO_IRQENABLE_I[18] ERRCONTROL4	Control error for lane 4
CAL_CSI2_COMPLEXIO_IRQENABLE_I[19] ERRCONTROL5	Control error for lane 5
CAL_CSI2_COMPLEXIO_IRQENABLE_I[20] STATEULPM1	Lane 1 in ULPM
CAL_CSI2_COMPLEXIO_IRQENABLE_I[21] STATEULPM2	Lane 2 in ULPM
CAL_CSI2_COMPLEXIO_IRQENABLE_I[22] STATEULPM3	Lane 3 in ULPM
CAL_CSI2_COMPLEXIO_IRQENABLE_I[23] STATEULPM4	Lane 4 in ULPM
CAL_CSI2_COMPLEXIO_IRQENABLE_I[24] STATEULPM5	Lane 5 in ULPM
CAL_CSI2_COMPLEXIO_IRQENABLE_I[25] STATEALLULPMENTER	All active lanes are entering the ULPM.
CAL_CSI2_COMPLEXIO_IRQENABLE_I[26] STATEALLULPMEXIT	At least one active lane exited the ULPM.

Table 10-8. CAL Write DMA Interrupts

Event	Description
IRQ_WDMA_STARTx x= [0 ... CAL_HL_HWINFO[18:13] WCTX - 1]	Frame start. Triggered by the Write DMA when a data word tagged as ATT_HDR_S, ATT_DAT_S, CTRL_HDR_S, PIX_HDR_S or PIX_DAT_FS has been detected by the Write DMA. Typically used by SW to detect when shadowed registers can be updated for the next frame. Refer to Section 10.4.6.8, CAL Write DMA , for more details.
IRQ_WDMA_ENDx x= [0 ... CAL_HL_HWINFO[18:13] WCTX - 1]	Frame end. Triggered by the Write DMA when the FE tag has been received by the cropping stage and the last data of the last line has been sent to memory. Therefore, this event may be triggered after the last data has been written to memory when data has been discarded by the cropping feature. The FE corresponds to a data word tagged as ATT_HDR_E, ATT_DAT_E, CTRL_HDR_E, PIX_HDR_E, PIX_DAT_FE or FE_CODE. Typically used by SW to detect when all data of a header, attribute packet, control packet or pixel frame has been written to memory. This event is triggered when the last OCP transaction has been sent to memory but before the response for this OCP transaction has been received from the target. Therefore, there is a small delay between the moment where the event is triggered and the last data can be read back from the buffer. Typically that delay is compensated by IRQ detection latencies.
IRQ_WDMA_CIRCx x= [0 ... CAL_HL_HWINFO[18:13] WCTX - 1]	Circular event. Triggered when the number of lines defined by CAL_WR_DMA_OFST_k[23:22] CIRC_MODE has been sent to the OCP master port.

Table 10-9. CAL Line Number Interrupt

Event	Description
IRQ_LINE_NUMBER	Line number reached. The line number programmed in CAL_LINE_NUMBER_EVT[29:16] LINE register bit-field) is received on CPORT# CAL_LINE_NUMBER_EVT[4:0] CPORT.

Table 10-10. CAL Video Port EOF Interrupt

Event	Description
IRQ_VPORT_EOF	Event triggered when data tagged as PIX_DAT_FE is sent to the video port. Typically used by SW to detect when all data has been sent to the video port.

On CAL top level, the different events trigger IRQs, if they have been enabled using the [CAL_HL_IRQENABLE_SET_j](#) register. The status can be read from the [CAL_HL_IRQSTATUS_j](#) register. The event-to-register mapping is shown in [Figure 10-4](#).

- IRQ_PPI1_VC and IRQ_PPI0_VC refer to events controlled by [CAL_CSI2_VC_IRQENABLE_I](#) register and described in [Table 10-6, CSI2 Low Level Protocol Interrupts](#).
- IRQ_PPI1 and IRQ_PPI0 refer to events controlled by [CAL_CSI2_COMPLEXIO_IRQENABLE_I](#) and described in [Table 10-6, CSI2 Low Level Protocol Interrupts](#) and [Table 10-7, CSI2 Complex I/O Interrupts](#).

All events are merged into a single CAL_IRQ signal available at CAL boundary.

NOTE: [CAL_HL_IRQSTATUS_j](#) does not refer to events, but is used to collect events tracked in [CAL_CSI2_VC_IRQSTATUS_I](#) and [CAL_CSI2_COMPLEXIO_IRQSTATUS_I](#) registers, and enabled by [CAL_CSI2_VC_IRQENABLE_I](#) and [CAL_CSI2_COMPLEXIO_IRQENABLE_I](#) registers. SW must use them to detect, if a Complex I/O or PPI event is pending and then get event details from the relevant second level IRQ status register. SW must only clear those events by setting the relevant bits in the [CAL_CSI2_VC_IRQSTATUS_I](#) and [CAL_CSI2_COMPLEXIO_IRQSTATUS_I](#) registers. [CAL_HL_IRQSTATUS_j](#) is automatically cleared by the HW when no more enabled Complex I/O or PPI events are pending

Figure 10-4. CAL Interrupt Events Mapping to Registers

10.4.5 CSI2 PHY Functional Description

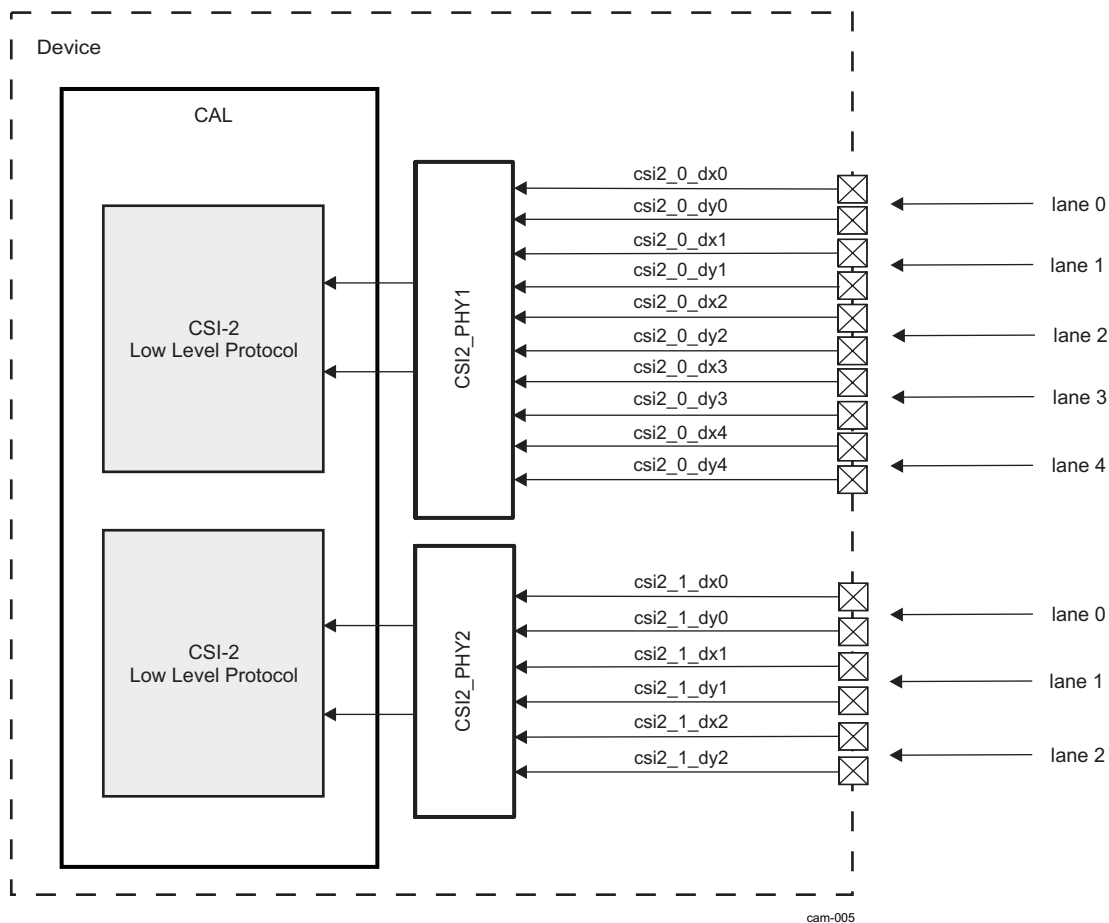

10.4.5.1 CSI2 PHY Overview

Two MIPI D-PHY compliant PHY receivers (CSI2_PHY1 and CSI2_PHY2, or generally referenced to as CSI2 PHY) immediately before the CAL module act as a physical connection and configuration of clock/data lanes with external sensors. A CSI2 PHY supports up to four configurations, depending on the required number of D-PHY data lane external sensors. The receivers are compatible with the *MIPI D-PHY Specification v1.00.00*. The selection of a CSI2 PHY in D-PHY mode must be done before reset and not on the fly.

The CSI2 PHY is controlled and must be configured first from the device Control Module for pad configuration. The differential data/clock lanes coming into the CSI2 PHY1 and CSI2 PHY2 are configured from registers explained in [Section 10.4.5.3, CSI2 PHY Link Initialization Sequence](#).

There are two CSI2 PHY instances integrated in the device. As shown in [Figure 10-5](#), the CSI2_PHY1 contains four data lanes and CSI2_PHY2 has two data lanes. [Figure 10-5](#) shows the two CSI2 PHY cases, with their signals further covered in [Section 10.4.6.2.1, CSI2 Physical Layer](#).

Figure 10-5. CSI2 PHY Diagram

NOTE: LANE 4 of CSI2_PHY1 can be used only as a data lane, never as a clock lane. All other configurations are possible.

CSI2_PHY1 and CSI2_PHY2 represent the overall PHY solution for connecting external sensors to feed the CAL module. The MIPI D-PHY function can support up to four data lane modules and one clock lane module. Reverse direction escape mode is not supported. The lane module polarity and positions are configurable; that is, any lane module can be chosen as the clock lane module (except otherwise notified), and the DX/DY data pad for each lane module can be configured as DP or DN pins defined. The configuration and the selection of D-PHY mode, data/clock are done through the device Control Module (see Chapter 20, Control Module). The only exception is the four-data-lane use case, in which one corner lane is allowed to be only a data lane. Both CSI2 PHY modules can be configured through serial configuration protocol (SCP) interface.

10.4.5.2 CSI2 PHY Configuration

The CSI2 PHY converts the bitstream, divided into 1 up to 4 serial data lanes, and one clock lane, into a bitstream compatible with the CSI2 low level protocol within the CAL module .

The CSI2 low level protocol engine only provides the SCP clock when CSI2 PHY registers are accessed and CAL_CTRL[21] PWRSCPCLK = 0. However, the CSI2 PHY needs at least 3 SCP clock cycles to come out of the reset state. Therefore, SW must perform a dummy read of a CSI2 PHY register (32 SCP clock pulses) to complete the CSI2 PHY reset sequence. Alternatively, the SCP clock can be programmed to be free-running by setting CAL_CTRL[21] PWRSCPCLK = 1 (not preferred).

The CAL_CSI2_COMPLEXIO_IRQSTATUS_I register logs complex I/O events of the following types:

- Line power-state change (all lanes in ultralow-power mode [ULPM], at least one lane exits ULPM, etc.)
- Error on one lane

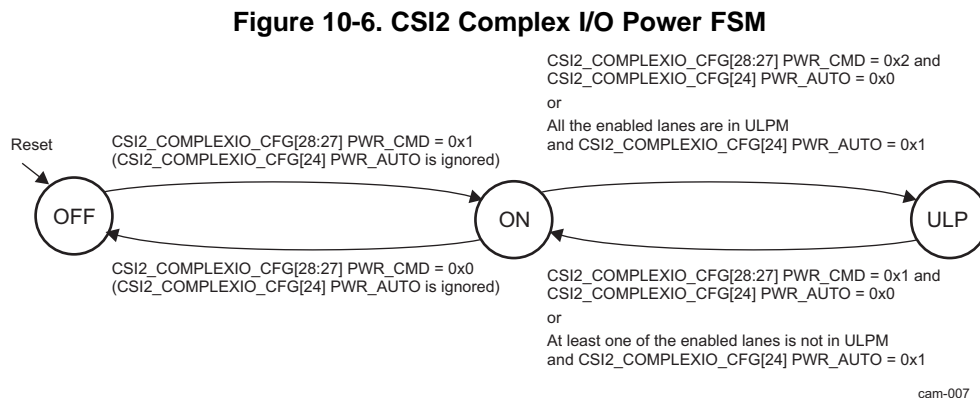

Some complex I/O parameters can be configured through the following registers:

- The REG0 register detects clock miss with respect to the MIPI D-PHY Specification v1.00.00 and control timing.
- The REG0 register reports completion of reset on the different parts of the module and configures the timing parameters.
- The CAL_CSI2_COMPLEXIO_CFG_I register contains the PWR_AUTO and PWR_CMD bit fields, which affect the power management of the complex I/Os.

The Complex I/O FSM has three power states: ON, OFF, and Ultralow Power (ULP). Two operation modes are available:

- Automatic mode, when the CAL_CSI2_COMPLEXIO_CFG_I[24] PWR_AUTO bit is set to 1. The transitions between ON and ULP states is done automatically based on the received ULPM signals from the complex I/O for the active lanes defined in CAL_CSI2_COMPLEXIO_CFG_I[] DATAx_POSITION bit-field, where x = [1...4].
- Manual mode, when the CAL_CSI2_COMPLEXIO_CFG_I[24] PWR_AUTO bit is set to 0 (default). The complex I/O power state is controlled by the CAL_CSI2_COMPLEXIO_CFG_I[28:27] PWR_CMD bit field. The allowed transitions are: OFF <-> ON and ON <-> ULP.

Figure 10-6 shows the complex I/O power finite state-machine (FSM).

Another register, [CAL_CSI2_TIMING_I](#), is used to control the power state of the complex I/O modules with regard to the differential line state. This register controls the mode of the three complex I/Os (RxMode and NoRxMode) and the delay between the differential lanes in STOP state and the complex I/O on NoRxMode. The [CAL_CSI2_TIMING_I\[15\] FORCE_RX_MODE_IO1](#) bit sets the complex I/O in RxMode or NoRxMode (stopped mode). The FORCE_RX_MODE_IO1 bit is automatically reset to 0 by hardware when the counter ends and the FSM returns to NoRxMode. Three bits ([CAL_CSI2_TIMING_I\[14\] STOP_STATE_X16_IO1](#), [CAL_CSI2_TIMING_I\[13\] STOP_STATE_X4_IO1](#), and the [CAL_CSI2_TIMING_I\[12:0\] STOP_STATE_COUNTER_IO1](#) bit field) configure the delay between line stop mode and complex I/O stop mode. The delay represents the number of functional clock cycles and can be calculated as follows:

$$\text{Total delay in functional clock cycles} = \text{CAL_CSI2_TIMING_I.STOP_STATE_COUNTER_IO1} \times (1 + \text{CAL_CSI2_TIMING_I.STOP_STATE_X16_IO1} \times 15) \times (1 + \text{CAL_CSI2_TIMING_I.STOP_STATE_X4_IO1} \times 3).$$

[Table 10-11](#) lists the possible values of the delay, in terms of the functional clock cycles, depending on the values of the STOP_STATE_X16_IO1 and STOP_STATE_X4_IO1 bits.

Table 10-11. CSI2 PHY Possible Time-Out Value for RxMode Counter

STOP_STATE_X16_IO1	STOP_STATE_X4_IO1	Possible Delay Value (in Functional Clock Cycles)
0x0	0x0	8191 (with step of 1)
0x0	0x1	32764 (with step of 4)
0x1	0x0	131056 (with step of 16)
0x1	0x1	524224 (with step of 64)

The FORCERXMODE signal is used at initialization time (complex I/O). [Figure 10-7](#) describes the ForceRxMode and StopState FSM to assert and deassert the FORCERXMODE signal and to monitor STOPSTATE from the complex I/O.

Figure 10-7. CSI2 PHY RxMode and StopState FSM

CAL asserts FORCERXMODE signal when the bit-field [CAL_CSI2_TIMING_I\[15\] FORCE_RX_MODE_IO1](#) is set by the SW. It can be reset by SW or automatically by HW when the time out occurs. At the same time the signal is asserted, the logic starts monitoring the StopState[0:4] signals corresponding only to the enabled lanes. When all of StopState signals for only the enabled lanes are asserted by the complex IO, the timer starts. When one of the signals, for the enabled lanes only, is not in StopState, the timer is reloaded and the logic re-starts monitoring the stop state signals. When the timer period is finished, the ForceRxMode signal is de-asserted.

10.4.5.3 CSI2 PHY Link Initialization Sequence

The MIPI D-PHY initialization sequence is not implemented within CSI2 PHY. The CAL CSI2 low level protocol coordinates the PHY initialization. The controller must ensure that the CSI2 PHY is held in RESET/WAIT for RX mode until the D-PHY transmitter is powered up and the link comes to the defined state. The controller can use the STOPSTATE and FORCERXMODE signals of CSI2 PHY for this purpose. STOPSTATE indicates the line states, while FORCERXMODE forces the receiver state-machine into "wait for stop state". In addition the pull down function on GPI buffer can be used to put a weak pull down on link. One possible initialization sequence is:

To fully initialize the CSI2 PHY, perform the following steps:

1. Configure all CSI2 low level protocol registers to be ready to receive signals/data from the CSI2 PHY:
 - i. Set [CAL_CSI2_COMPLEXIO_CFG_I\[18:16\]](#) DATA4_POSITION.
 - ii. Set [CAL_CSI2_COMPLEXIO_CFG_I\[14:12\]](#) DATA3_POSITION.
 - iii. Set [CAL_CSI2_COMPLEXIO_CFG_I\[10:8\]](#) DATA2_POSITION.
 - iv. Set [CAL_CSI2_COMPLEXIO_CFG_I\[6:4\]](#) DATA1_POSITION.
 - v. Set [CAL_CSI2_COMPLEXIO_CFG_I\[2:0\]](#) CLOCK_POSITION.
 - vi. Set the CTRL_CORE_CONTROL_CSI[10:9] CSI0_CAMMODE (for CSI2_PHY1) and CTRL_CORE_CONTROL_CSI[2:1] CSI1_CAMMODE (for CSI2_PHY2).

CAUTION

The above settings must be done before the CSI2 PHY is active.

- vii. A dedicated internal clock gate control is present for each CSI2 PHY. Enable/disable the internal CTRLCLK from the CTRL_CORE_CONTROL_CSI register by setting the following bits:
 - [8] CSI0_CTRLCLKEN for CSI2_PHY1
 - [0] CSI1_CTRLCLKEN for CSI2_PHY2
2. CSI2 PHY and link initialization sequence:
 - a. Deassert the CSI2 PHY reset:
 - i. Set [CAL_CSI2_COMPLEXIO_CFG_I\[30\]](#) RESET_CTRL to 0x1.

CAUTION

For the [CAL_CSI2_COMPLEXIO_CFG_I\[29\]](#) RESET_DONE bit to be set to 0x1 (reset completed), the external sensor must be active and sending the MIPI HS BYTECLK.

The following registers can be set only after deasserting the CSI2 PHY reset and before asserting the FORCERXMODE signal:

- [REG0](#)
 - [REG1](#)
 - [REG2](#)
- b. Assert the FORCERXMODE signal:
 - i. Set [CAL_CSI2_TIMING_I\[15\]](#) FORCE_RX_MODE_IO1 to 0x1.
 - c. Connect pulldown on CSI2 PHY link (DP/DN) by asserting the respective PIPD signals (PIPD = 0):
 For CSI2_PHY1 pulldown on signals through the SMA_SW_3[19] CSI2_0_XY_PIPD register bit.
 For CSI2_PHY2 pulldown on signals through the SMA_SW_3[18] CSI2_1_XY_PIPD register bit.
 - d. Power up the CSI2 PHY:
 - a. Set [CAL_CSI2_COMPLEXIO_CFG_I\[28:27\]](#) PWR_CMD to 0x1.
 - e. Check whether the state status reaches the ON state:
 - [CAL_CSI2_COMPLEXIO_CFG_I\[26:25\]](#) PWR_STATUS = 0x1
 - f. Wait for STOPSTATE = 1 (for all enabled lane modules):
 - a. The timer is set through the [CAL_CSI2_TIMING_I\[14:0\]](#) bit field. The reset value can be kept.
 - b. Wait until [CAL_CSI2_TIMING_I\[15\]](#) FORCE_RX_MODE_IO1 = 0x0. It is automatically put at 0 when all enabled lanes are in STOPSTATE and the timer is finished.
 - g. Release PIPD signals (PIPD = 1):
 For CSI2_PHY1 pulldown on signals through the SMA_SW_3[19] CSI2_0_XY_PIPD register bit.
 For CSI2_PHY2 pulldown on signals through the SMA_SW_3[18] CSI2_1_XY_PIPD register bit.

- The CSI2 PHY is initialized and ready/active in CSI-2 (D-PHY) mode.

10.4.5.4 CSI2 PHY Error Signals

In D-PHY mode, the CSI2 PHY supports the following error detection and signaling to the associated receiver:

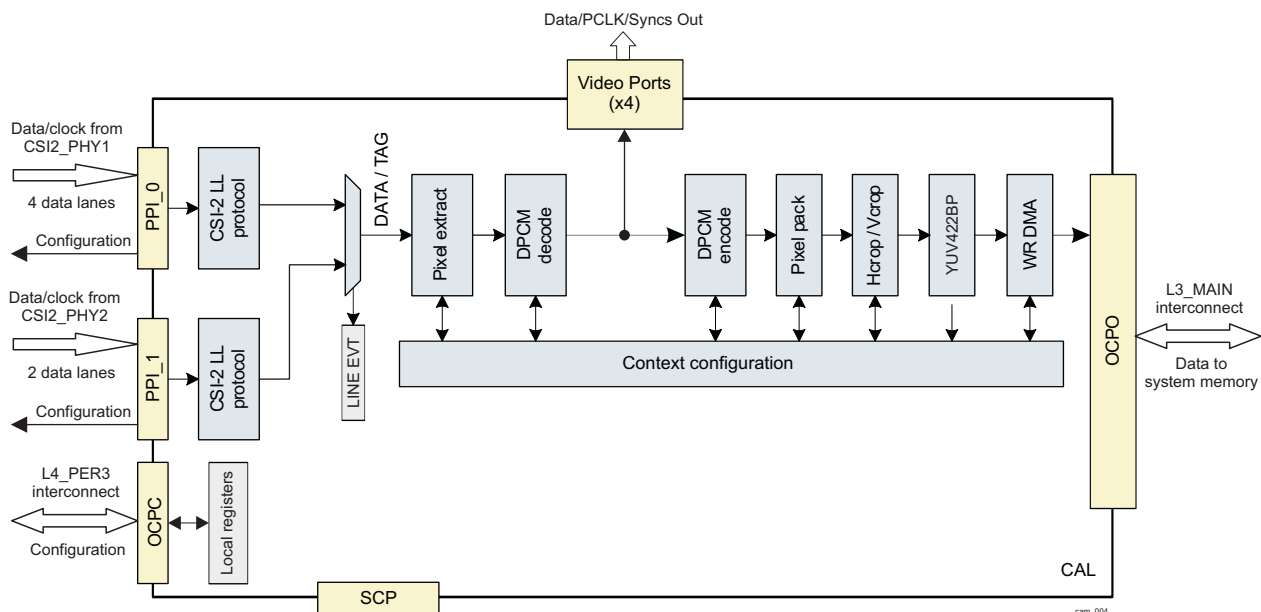

- ERRSOTHS: Flags 1-bit errors in the HS start of transmission synchronization pattern. In this error scenario, the CSI2 PHY continues to receive the data and pass it to the receiver, but confidence in the data may be low, because of the 1-bit error seen in sync. This signal, if asserted, is high for one cycle of RXBYTECLKHS.
- ERRSOTSYNCHS: Flags multiple bit errors in the HS start of transmission synchronization pattern. In this case, the CSI2 PHY cannot achieve proper synchronization and does not pass the received data to the receiver. This signal, if asserted, is high for one cycle of RXBYTECLKHS.
- ERRCONTROL: Flags the control sequence error; that is, when the LP sequence observed on line is not recognized as a valid control sequence. This signal, if asserted, is high until the next change in the state of the LP line.
- ERRESC: Flags the escape entry error; that is, when the escape entry sequence is unrecognized. This signal, if asserted, is high until the next change in the state of the LP line.
- ERRSYNCESC: Flags the low-power data transmission synchronization error. This error is flagged if the number of bits received during a low-power data transmission is not a multiple of 8 bits. This signal, if asserted, is high until the next change in the state of the LP line. In case the number of received bits is 1 less than a multiple of 8, RXVALIDESC is also asserted together with ERRSYNCESC, and an erroneous data byte is output on RXDATAESC. In other cases of this error, RXVALIDESC is not asserted and an erroneous data byte is not sent out.

10.4.6 CAL Functional Description

10.4.6.1 CAL Block Diagram

Figure 10-8 shows a top-level overview diagram of the CAL module.

Figure 10-8. CAL Top-Level Diagram

The CAL module is composed of two possible data sources (two CSI-2 low level protocol decoders) plus a pixel data processing pipeline.

The CSI-2 LL protocol block receives data from a D-PHY receiver (CSI2 PHY, up to four data pairs), merges data from multiple lanes, detects and correct errors, extracts the virtual channel ID, detects and extracts the synchronization codes and re-formats the data into a stream understood by the CAL processing pipeline. Each PPI interface has a small FIFO to accommodate latencies to access the CAL pipeline.

The data from all sources is multiplexed with 64-bit granularity and sent to the CAL pipeline for further processing. The data pipeline forwards 64-bit wide data words as well as a 5-bit wide data qualifier + 4-bit validity qualifier + 5-bit CPORT number referred as TAG in this chapter.

The TAG is set by the data source and controls how the different stages in the processing pipeline behave. [Figure 10-9](#) summarizes possible values for the data qualifier and the corresponding behavior of the different processing stages:

Figure 10-9. CAL Data Pipeline TAGs

ID	Label	Description / generation	Pixel extraction	DPCM decode	DPCM encode	Pixel packing	Video Port	WRITE DMA
0	IDLE	Indicates no active data in the pipeline. Used to gate processing logic and save power	idle	idle	idle	idle	idle	idle
1	ATT_HDR_S	Attribute header (bytes 0~7)	bypass	bypass	bypass	bypass	idle	reset + write
2	ATT_HDR_E	Attribute header (bytes 8~15)	bypass	bypass	bypass	bypass	idle	write + flush
3	ATT_DAT_S	Attribute payload (bytes 16~23)	bypass	bypass	bypass	bypass	idle	reset + write
4	ATT_DAT	Attribute payload (bytes 23 ~ last-8)	bypass	bypass	bypass	bypass	idle	write
5	ATT_DAT_E	Attribute payload (bytes last-7 ~ last)	bypass	bypass	bypass	bypass	idle	write + flush
6	CTRL_HDR_S	EOP / Control packet (bytes 0~7)	bypass	bypass	bypass	bypass	idle	reset + write
7	CTRL_HDR_E	EOP / Control packet (bytes 8~15)	bypass	bypass	bypass	bypass	idle	write + flush
8	DPCM_INIT	Initialization data for the DPCM decoder (available at CAL module level, not used in the device)	bypass	init + discard	na	na	na	na

15	PIX_DAT_LE	Data payload (bytes last-7 ~ last, line 2 ~ n-1)	process	process	process	process	output	write + flush
16	FE_CODE	Frame end short packet received. Used for data received from PPI when the number of lines per frame is not known	bypass	bypass	bypass	bypass	frame end	frame end

cam_009

NOTE: [Figure 10-9](#) does not describe all possible configurations for the CAL pixel processing stages. Depending on the use case, each pixel processing stage (extraction, DPCM decoding/encoding, packing) can be individually configured or bypassed via a dedicated bit-field in the [CAL_PIX_PROC_i](#) register.

10.4.6.2 CSI2 Low Level Protocol

CAL has two PPI interfaces that connect directly to two D-PHY instances of up to 4 lanes each. It also implements an OCP to SCP bridge to access the complex IO internal registers.

10.4.6.2.1 CSI2 Physical Layer

The CSI2 serial interface is a unidirectional differential serial interface with data/clock for the physical layer.

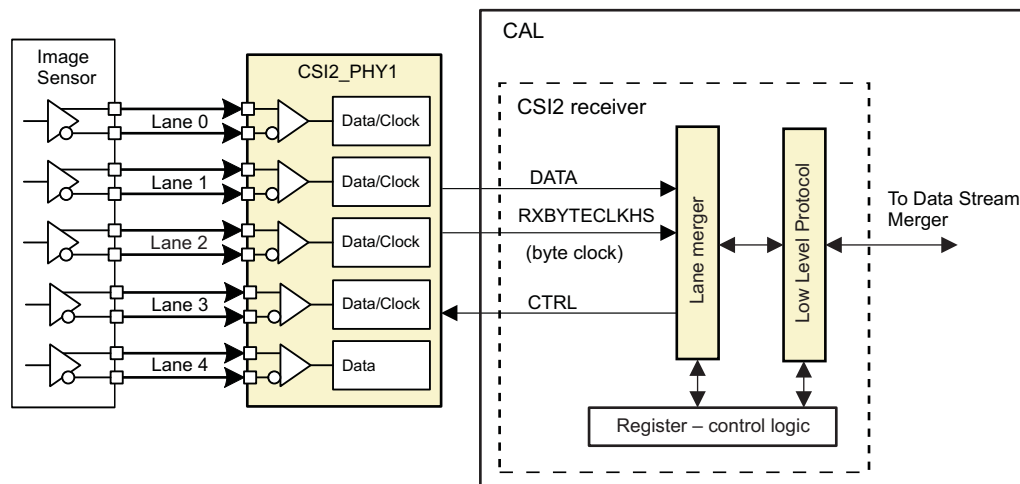

The maximum CSI2 data transfer capacity is 1500 Mbps per data lane. The speed of the link is reconfigurable by SW only when the CSI2 PHY is in "stop state" or in ULPM (ultra-low power mode).

Data-clock signaling consists of two to five differential signal pairs: from one to four data lanes and one clock lane. The minimum configuration is one data pair and one clock pair.

- The data signal carries the bit-serial data. The CSI2 transmitter in the image sensor sends the data in-quadrature with the dual-data rate (DDR) clock in HS mode; otherwise, the clock is extracted from the received data in LS (low speed) mode. Data is transmitted byte-wise, LSB first. The CSI2 complex I/O receives the data and sends the byte stream to the CSI2 LL protocol core.
- The clock signal carries the DDR clock signal.
- The SW has to configure the order of the data lanes to indicate the byte order while merging the received bytes for each CSI2 PHY into a byte stream.

Figure 10-10 is the CSI2 Low Level Protocol engine block diagram (it assumes there are four CSI2 image sensor data lanes). The CSI2 receiver receives the byte data coming from a CSI2 D-PHY receiver (Figure 10-10 shows CSI2_PHY1 with up to four data pairs), converts the data to byte stream, detects and corrects errors, extracts the virtual channel ID, detects and extracts the synchronization codes, reformats the data, and forwards it to the the CAL Data Stream Merger.

Figure 10-10. CSI2 Low Level Protocol Engine Block Diagram

cam-019

Each physical lane can be a data or clock lane with a restriction to the fourth lane, which can only be data (see Section 10.4.5.1, CSI2 PHY Overview). The clock/data lane must be configured before transmission to indicate the byte order, while merging the received bytes into a byte stream shows the reachable speed per data lane function of data lane numbers.

Lanes are configured through the CAL_CSI2_COMPLEXIO_CFG_I registers. The CAL_CSI2_COMPLEXIO_CFG_I[2:0] CLOCK_POSITION bit field and the CAL_CSI2_COMPLEXIO_CFG_I[3] CLOCK_POL bit configure which lane transmits the clock and define its polarity. The DATAx_POSITION and DATAx_POL bit-fields configure the data lanes and their polarity, where x is the number of the data lane (x = 1 to 4). When the DATAx_POSITION field is set to 0, data lane x is not used.

CAUTION

Lane 4 (position 5) supports only data. The CLOCK_POSITION must not be set at position 5.

Table 10-12. CSI2_PHY1 I/O Description

Signal Name		I/O ⁽¹⁾	Description
csi2_0_dx0	lane 0 (position 1)	I	Serial data/clock input
csi2_0_dy0			
csi2_0_dx1	lane 1 (position 2)	I	Serial data/clock input
csi2_0_dy1			
csi2_0_dx2	lane 2 (position 3)	I	Serial data/clock input
csi2_0_dy2			
csi2_0_dx3	lane 3 (position 4)	I	Serial data/clock input
csi2_0_dy3			
csi2_0_dx4	lane 4 (position 5)	I	Serial data input only
csi2_0_dy4			

⁽¹⁾ I = Input

Table 10-13. CSI2_PHY2 I/O Description

Signal Name		I/O ⁽¹⁾	Description
csi2_1_dx0	lane 0 (position 1)	I	Serial data/clock input
csi2_1_dy0			
csi2_1_dx1	lane 1 (position 2)	I	Serial data/clock input
csi2_1_dy1			
csi2_1_dx2	lane 2 (position 3)	I	Serial data/clock input
csi2_1_dy2			

⁽¹⁾ I = Input

Lanes support the two operating modes:

- HS mode: High-speed transmit mode
- Off mode: Lane is off.

10.4.6.2.2 CSI2 Multi-lane Layer and Lane Merger

The layer consists of lane merger logic in order to merge the incoming serial stream into a byte stream. The bits are sent with LSB first. The number of active lanes is configurable through register. The order of the lanes at the CSI-2 receiver core is also configurable. The number of lanes can be changed only in ULPM or when all data lanes are in "stop state" (OFF mode).

The lane merger can merge up to four lanes into a single byte stream, and is not used for a single lane.

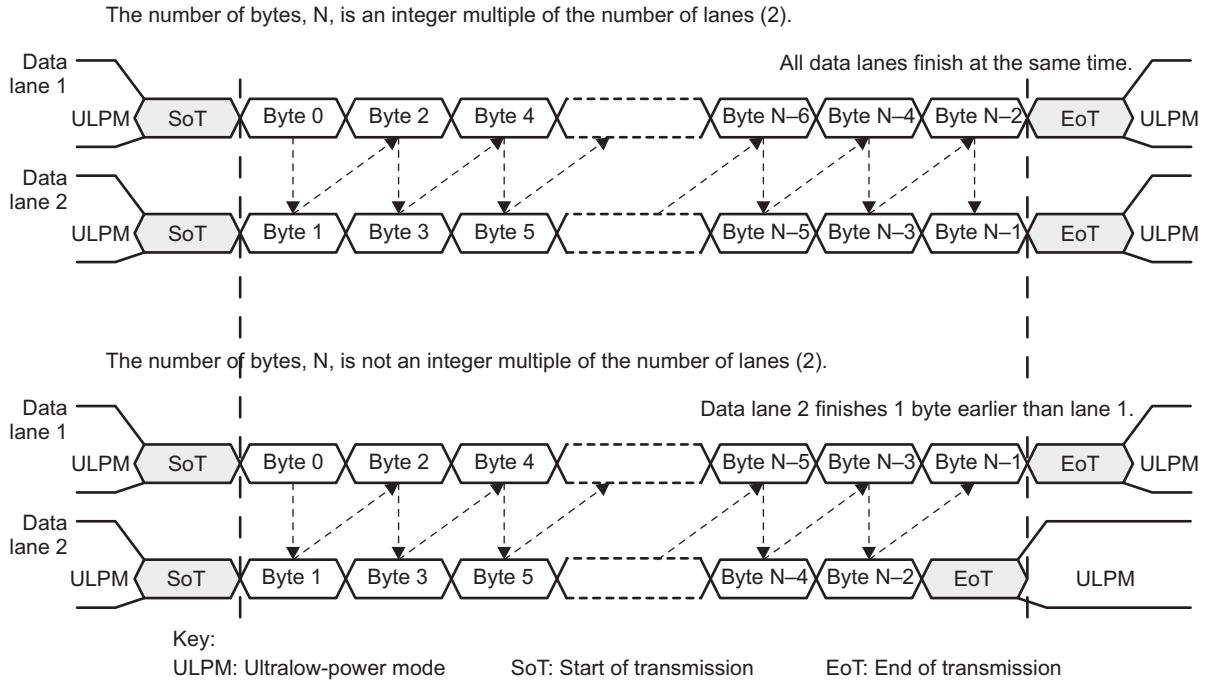

Figure 10-11 to Figure 10-14 show the byte position into each serial link for one to four data lane configurations. The byte stream always starts from lane 1. It finishes on one of the lanes, depending on the number of bytes to receive and the number of lanes.

Figure 10-11. CSI2 One Data-Lane Configuration

camss-240

Figure 10-12. CSI2 Two Data-Lane Merger Configuration

camss-239

Figure 10-14. CSI2 Four Data-Lane Merger Configuration

10.4.6.2.3 CSI2 Protocol Layer

The low-level protocol (LLP) is a byte-oriented protocol from the lane merger layer. It supports short and long packet formats.

The CSI2 protocol layer defines how image-sensor data is transported onto the physical layer.

The feature set of the protocol layer implemented by the CSI2 receiver is:

- Transport of arbitrary data (payload-independent)
- 8-bit word size
- Support for up to four interleaved virtual channels on the same link
- Special packets for frame-start, frame-end, line-start, and line-end information
- Error-correction code (ECC) for 1-bit error correction or 2-bit error detection in the header
- 16-bit checksum code for payload error detection

Figure 10-15 shows the CSI2 protocol layer with short and long packets.

Figure 10-15. CSI2 Protocol Layer With Short and Long Packets

Key:
 ST: Start of transmission ET: End of transmission
 PH: Packet header PF: Packet footer
 ULPM: Ultralow-power mode SP: Short packet

camss-241

Two packets are always separated from each other with a sequence of ET, ULPM, and ST.

10.4.6.2.3.1 CSI2 Short Packet

A short packet is identified by data types 0x00 to 0x0F. A short packet can be used for frame or line synchronization or for generic data. A short packet contains only a Packet Header; a Packet Footer is not be present. [Figure 10-16](#) shows the structure of a short packet.

Figure 10-16. CSI2 Short Packet Structure

camss-242

NOTE: CAL accepts but does not use the frame number or line numbers transmitted by the sensor as required by the MIPI CSI-2 standard.

The ECC byte allows single-bit errors to be corrected and 2-bit errors to be detected in the short packet.

Short packets apply to all contexts using the same virtual channel ID . The data type associated with the context is not used to distinguish which context is used when receiving short packets.

10.4.6.2.3.2 CSI2 Long Packet

A long packet is identified by data types 0x10 to 0x37. A long packet consists of three elements:

- A 32-bit packet header (PH)
- An application-specific data payload with a variable number of 8-bit data words
- A 16-bit packet footer (PF)

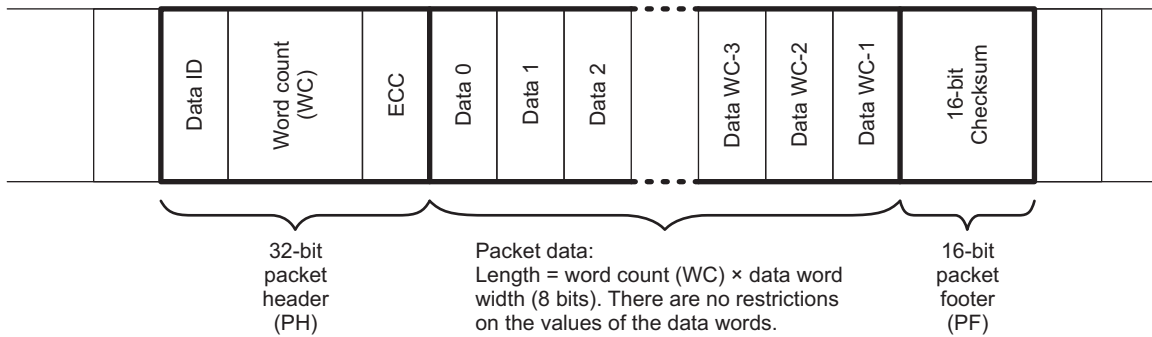

The packet header is further composed of three elements:

- An 8-bit data identifier
- A 16-bit word count field
- An 8-bit ECC

The packet footer has one element, a 16-bit checksum.

[Figure 10-17](#) and [Table 10-14](#) show the structure of a long packet.

Figure 10-17. CSI2 Long Packet Structure

camss-243

Table 10-14. CSI2 Long Packet Structure Description

Packet Part	Field Name	Size (Bits)	Description
Header	Data ID	8	Contains the virtual channel identifier for data and the data-type for the application specific payload data
	Word count	16	Number of 8-bit data words in the Data Payload between the end of the Packet Header and the start of the Packet Footer. Neither the Packet Header nor the Packet Footer are included in the Word Count.
	ECC	8	ECC for data ID and WC field. Allows 1-bit error recovery and 2-bit error detection.
Data	Data	WC-8	Application-specific payload (WC words of 8 bits)
Footer	Checksum	16	16-bit CRC for packet data

There are no restrictions on the size of the packet data, but each data format can impose additional restrictions on the length of the payload data (for example, a multiple of 4 bytes).

10.4.6.2.3.3 CSI2 ECC and Checksum Generation

The CSI2 receiver includes an ECC in the packet header and a checksum in the packet footer for long-packet transmission. These two fields can be used to detect and/or correct errors in the received packet.

10.4.6.2.3.3.1 CSI2 ECC

To detect and correct transmission errors of the header of short and long packets, an 8-bit ECC is included in the header of packets (short and long packet). It allows single-bit errors to be corrected and 2-bit errors to be detected in the packet header.

The ECC concerns all the fields for a short packet (data ID and short-packet data field) and the packet header for a long packet (data ID and word count). The ECC can only correct one error. Additional errors cannot be repaired, but they are flagged. After the end of the Packet Header, the receiver reads the next Word Count * 8-bit data words of the Data Payload. While reading the Data Payload the receiver does not look for any embedded sync codes. Therefore, there are no limitations on the value of a data word.

The CSI2 receiver ECC is compared against the CSI2 transmitter ECC embedded in the bitstream. If the ECC does not match, an interrupt is triggered.

For long and short packets, the correction is always done, if there is only one error per packet header.

An ECC error with or without correction can be reported at two levels, depending on the type of packet. Table 10-15 describes the field in which events are logged. Logging cannot be disabled, but SW can set the corresponding bit in the CAL_CSI2_VC_IRQENABLE_I register to prevent event generation at a higher level.

Table 10-15. CSI2 ECC Event Logging

Short and Long Packet	
With correction	Global CAL_CSI2_VC_IRQSTATUS_I[] ECC_CORRECTION_IRQ_x, where x = [0 to 3]
Without correction	Global CAL_CSI2_VC_IRQSTATUS_I[] ECC_NO_CORRECTION_IRQ_x, where x = [0 to 3]

The ECC check can be disabled (short and long packet) by setting the [CAL_CSI2_PPI_CTRL_I\[2\]](#) ECC_EN bit to 0. Setting the bit to 1 enables the ECC check.

Refer to the MIPI CSI-2 1.0 standard for more details on ECC generation.

10.4.6.2.3.3.2 CSI2 Checksum

Once the CSI2 receiver has read the Data Payload, it reads the checksum in the Packet Footer. In the generic case, the length of the Data Payload is a multiple of 8-bit data words. In addition, each data format may impose additional restrictions on the length of the payload data, e.g. multiple of four bytes. Each byte is transmitted LSB first.

To detect errors in transmission of the payload of long packets, a 16-bit CRC checksum is computed on the payload of the long packets in the transmitter. This CRC is stored in the packet footer. The CSI2 receiver checksum is compared against the CSI-2 transmitter checksum. If the checksum does not match, an interrupt is triggered.

CRC errors are logged in the [CAL_CSI2_VC_IRQSTATUS_I\[\]](#) CS_IRQ_x (where x = [0 to 3]) register bit-fields. Logging cannot be disabled, but SW can configure the corresponding bit in the [CAL_CSI2_VC_IRQENABLE_I](#) register to prevent event generation at a higher level.

Since the payload has been already transferred into memory, it is not possible to discard the data but only to generate an interrupt.

10.4.6.2.3.4 CSI2 Alignment Constraints

Payload data may be transmitted in any byte order restricted only by data format requirements. Multi-byte elements such as Word Count, Checksum and the Short packet 16-bit Data Field is transmitted LSB byte first.

10.4.6.2.3.5 CSI2 Data Identifier

The data identifier byte contains the virtual channel identifier (VC) value and the data-type (DT) value, as shown in [Figure 10-18](#). The VC value is contained in the 2 MSBs of the data identifier byte. The DT value is in the 6 LSBs of the data identifier byte.

Figure 10-18. CSI2 Data Identifier Structure

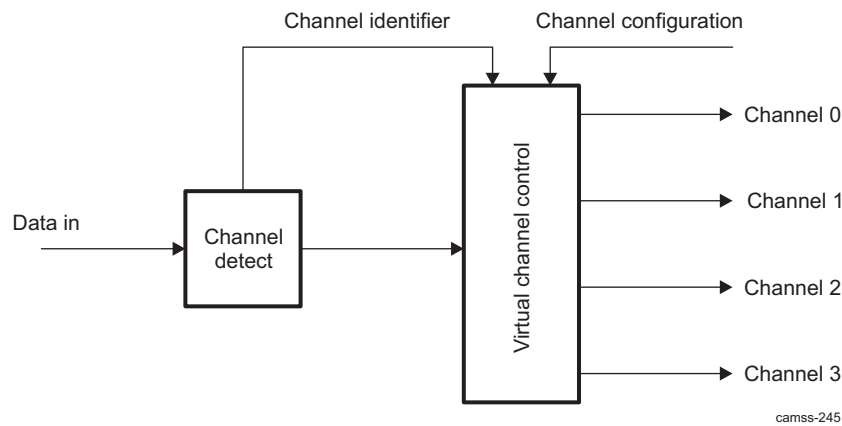

camss-244

10.4.6.2.3.6 CSI2 Virtual Channel ID

The CSI2 protocol layer transports virtual channels. Virtual channels are built of frames. A frame can comprise embedded data and image-sensor data. Two contexts are used to send the two types of data (embedded and image-sensor) separately. Each frame is identified by unique mandatory synchronization codes: frame start and frame end. Line start and line end synchronization codes are optional for the transmitter. A set of registers is associated with each context defined by the virtual channel ID and the data type. [Figure 10-19](#) shows a virtual channel.

Figure 10-19. CSI2 Virtual Channel

10.4.6.2.3.7 CSI2 Synchronization Codes

Each frame is clearly identified by a synchronization code for the start of frame and the end of frame. The start of line and end of line can be sent by the image sensor but it is optional.

In order to send the synchronization codes, the camera uses the short packets. Data reception from the image-sensor module uses four synchronization codes embedded in the serial bitstream:

- FSC: Identifies the start of a new frame
- LSC: Identifies the start of a new line; received for every line
- LEC: Identifies the end of a line; received for every line
- FEC: Identifies the end of the last line and the end of the current frame

[Table 10-16](#) summarizes the synchronization code values.

Table 10-16. CSI2 Synchronization Codes

Synchronization Code	Value	Comments
FSC	0x0	Mandatory
FEC	0x1	Mandatory
LSC	0x2	Optional
LEC	0x3	Optional
Reserved	0x4 to 0x7	Not used

10.4.6.2.3.8 CSI2 Generic Short Packet Codes

When the synchronization code value is from 0x8 to 0xF, the short packet is called a generic short packet. Short packets are not processed by the camera interface hardware. A generic short packet is stored in a register without the ECC and an interrupt can be generated. Therefore, generic short packets must be handled by software.

An interrupt (logged in [CAL_CSI2_COMPLEXIO_IRQSTATUS_I](#)[28] SHORT_PACKET register bit) indicates to the application the short packet event. Logging cannot be disabled, but SW can set the corresponding bit in the [CAL_CSI2_COMPLEXIO_IRQENABLE_I](#) register to prevent event generation at a higher level. It is SW responsibility to read the register [CAL_CSI2_SHORT_PACKET_I](#) before the next short packet with a code between 0x8 and 0xF. There is a single register for capturing the generic short packets since there is no data type in it to be associated with context.

10.4.6.2.3.9 CSI2 Frame Structure and Data

Each frame consists of short packets to indicate SOF and EOF. Optional short packets for start of line and end of line can be sent by the image sensor.

Some information before and after the picture data can be sent by the image sensor as SOF and EOF information. It is decoded by the receiver and is sent to the system memory through the OCPO port.

For each frame, the pixel data (arbitrary data or user-defined byte data) are valid only after an SOF short packet. If the data are invalid, they are discarded by the protocol engine.

A frame contains embedded data and image-sensor data. [Figure 10-20](#) shows where the embedded data and image-sensor data are in the frame. The frame is scanned in raster order starting from the top-left corner, as shown in [Figure 10-20](#) and [Figure 10-21](#). The following definitions for a frame apply:

- Zero or more SOF status lines (SOF lines) can be embedded at the beginning of a CSI2 frame.
- The image data comprises pixels of the same or different data formats. The image embedded data is carried using separate data types and virtual channels (see [Section 10.4.6.2.3.10, CSI2 Virtual Channel and Context](#)).
- Zero or more EOF status lines (EOF lines) can be embedded at the end of a CSI2 frame.
- The SOF lines, pixel data, and EOF lines do not overlap.

The CSI2 receiver does not use the information in the status lines. However, it extracts it and stores it in memory for use by software.

Because the data types are different, the data is carried using separate data types called virtual channels. Those must be mapped to the adequate context. The CSI2 receiver uses a different context for embedded data and image-sensor data. See [Section 10.4.6.2.3.10, CSI2 Virtual Channel and Context](#).

Embedded data is supported as a context by the CSI2 receiver; therefore, there is no specific hardware support for embedded data.

Figure 10-20. CSI2 General Frame Structure (Informative)

Key:

 FS: Frame start

PF: Packet footer
 FE: Frame end

camss-246

Figure 10-21 shows the frame structure of a YUV4:2:2 interlaced video frame without embedded data.

Figure 10-21. CSI2 Digital Interlaced Video Frame (Informative)

Key:

- PH: Packet header
- FS: Frame start
- LS: Line start
- PF: Packet footer
- FE: Frame end
- LE: Line end

camss-247

The period between the LEC and the new LSC is called line blanking period. The time between the FEC and the new FSC is called frame blanking period. The receiver works with "near zero" line blanking period.

NOTE: The embedded information (SOF & EOF lines) is never compressed (no DPCM). The embedded information covers full lines. The embedded information is not encoded in the same data format as the pixel data. The CSI-2 receiver extracts the embedded information but does not modify the data format.

The pixel data can be compressed.

10.4.6.2.3.10 CSI2 Virtual Channel and Context

The CSI2 protocol layer transports virtual channels. The virtual channels separate different data flows interleaved in the same data stream. Each virtual channel is identified by a unique channel identification number in the packet header. This channel identification number is encoded in the 2-bit code.

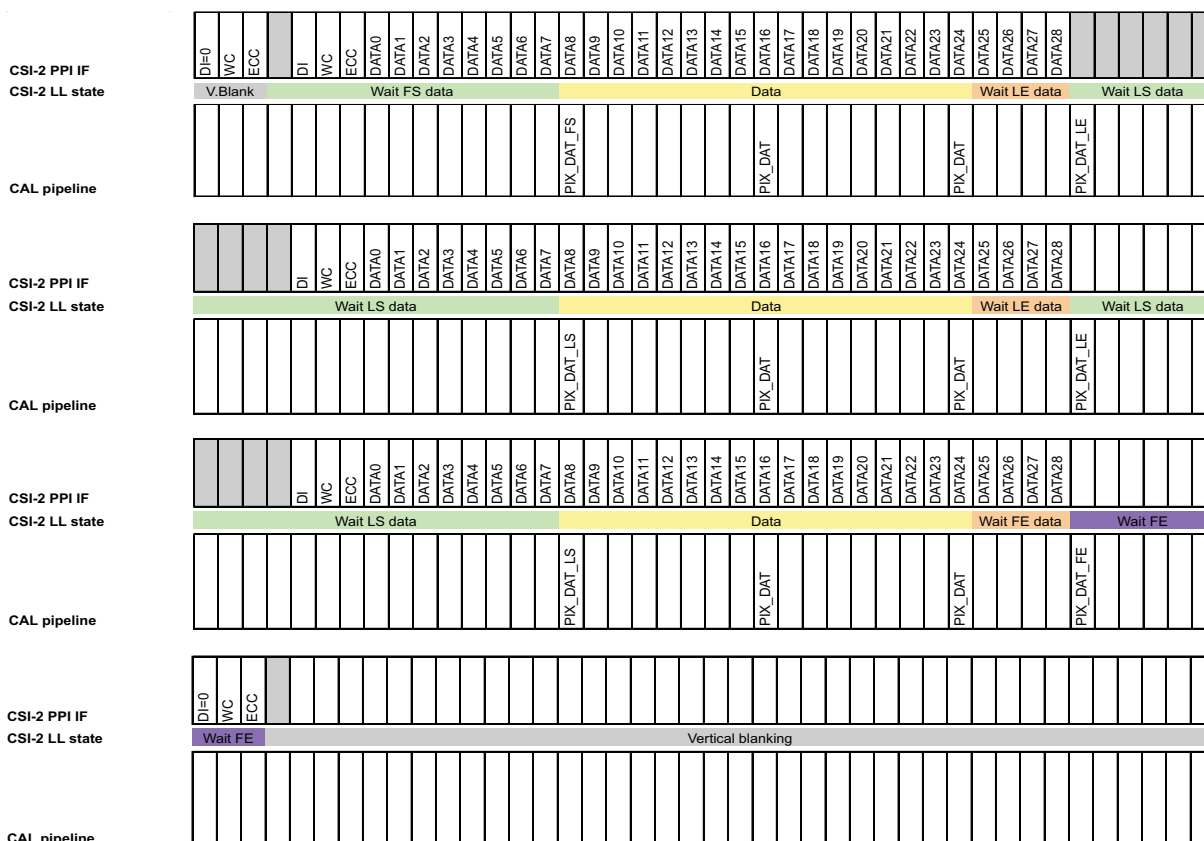

The CSI2 receiver monitors the channel identifier number and demultiplexes the interleaved data streams. The CSI2 receiver supports up to four concurrent virtual channels. The virtual channel values used for each channel are as follows:

- Virtual channel 0 -> 0x0
- Virtual channel 1 -> 0x1
- Virtual channel 2 -> 0x2
- Virtual channel 3 -> 0x3

10.4.6.2.4 CSI2 TAG Generation FSM

Figure 10-22 shows how the synchronization codes for the CAL internal pipeline are extracted from the CSI-2 stream. CSI-2 PPI IF corresponds to the byte stream after lane merge and PHY LS -> HS transition detection. CSI-2 LL state corresponds to the internal state of the TAG generation engine. CAL pipeline corresponds to the tags sent to the CAL processing pipeline.

Figure 10-22. CSI-2 LL Tag Generation Example - Line Mode

cam_010

Data is packed into words of 64-bits before it can be sent to the shared CAL processing pipeline. Each PPI has its own TAG generation & packing state machine. Both CSI2 PHYs are therefore independent and can operate simultaneously. Each PPI FSM has 8 copies of the CAL_CSI2_CTXy_I (y = [0 to 7], CAL_CSI2_CTX0_I through CAL_CSI2_CTX7_I) state registers (that is, contexts).

To use a context, SW must define:

- The used virtual channel (through CAL_CSI2_CTXy_I[7:0] VC register bit-field)
- The expected MIPI CSI-2 Data Type (through CAL_CSI2_CTXy_I[5:0] DT bit-field)
- The CPORT ID to use (through CAL_CSI2_CTXy_I[12:8] CPORT bit-field) for the data, and if it should be tagged as Attribute (that is, Embedded) data or as Pixel data (through CAL_CSI2_CTXy_I[13] ATT bit).

Attribute data is tagged using ATT_DAT_S, ATT_DAT and ATT_E tags. Pixel data is tagged using PIX_DAT_FS, PIX_DAT, PIX_DAT_LE, PIX_DAT_LS, PIX_DAT_FE. Data reception is disabled by setting CAL_CSI2_CTXy_I[5:0] DT bit to 0.

The tag generation FSM accumulates words of up to 64-bits of data from the physical interface. Two SW selectable modes are supported:

- Line mode (set by CAL_CSI2_CTXy_I[14] PACK_MODE = 0). In this mode CAL generates frame (PIX_DAT_FS; PIX_DAT_FE) and line (PIX_DAT_LS, PIX_DAT_LE) synchronization codes using synchronization information provided by the CSI-2 transmitter. It pads words with 0's when the line end or frame end is reached and generates the adequate data validity qualifier (VQ). Line and frame starts always correspond to full 64-bit words (VQ=0x0). This is typically the mode to be used to receive pixel data.
- Frame mode (set by CAL_CSI2_CTXy_I[14] PACK_MODE = 1). In this mode CAL only generates PIX_DAT_FS and PIX_DAT_FE synchronization codes. PIX_DAT_LE and PIX_DAT_LS are replaced by PIX_DAT and adequate data validity qualifiers are generated to create a contiguous stream. This mode is typically used to receive a JPEG frame from a CSI-2 camera.

This appended dummy data can be cropped by the Write DMA, or the hardware accelerator attached to the Video port. The shared CAL processing pipeline therefore always receives full 64-bit words. The line length is detected from the CSI-2 long packet header and mismatches are detected through CRC errors.

The tag generation FSM ensures that only valid TAG sequences can be provided to the shared CAL processing pipeline. FS, LS and LE codes are directly extracted from the CSI-2 stream. The FE code is not directly available and can be generated by two mechanisms:

- If SW knows the number of lines transmitted by the camera, it must write it into the CAL_CSI2_CTXy_I[29:16] LINES register bit-field. The tag generation FSM will send a FE TAG for the last received line of each frame instead of the LE TAG. This leads to regular video timings and avoids potential artifacts. CAL generates the FE_CODE tag when the FE short packet is received earlier than expected (for example, incorrect configuration or lines discarded due to transmission errors). The PIX_DATA_FE tag is generated at the end of the last line specified in CAL_CSI2_CTXy_I[29:16] LINES bit-field. Additional lines received for the same frame are discarded.
- If the number of lines is not known, SW must set the CAL_CSI2_CTXy_I[29:16] LINES register bit-field to 0. The tag generation FSM sends the PIX_DAT_LE TAG for the last line in the case and FE_CODE tag line when a FE short packet is received.

No LS/LE tags are generated when CAL_CSI2_CTXy_I[13] ATT = 1.

Figure 10-23 through Figure 10-26 illustrate the operation of the packing stage.

cam_013

Figure 10-26. CSI-2 Packing – Example 4

cam_014

Data is discarded and an FIFO_OVR event is triggered when the CAL shared pipeline cannot accept the data from PPI interfaces fast enough. The tag generation FSM ensures however that only valid tag sequences can be generated:

- Only a few words are dropped in the middle of a line: corresponding data words are dropped and synchronization TAGs (LE or FE) are transmitted normally. The line where the overflow has occurred is therefore corrupted (that is, pixels shifted left), but synchronization is recovered from the next line start.
- The overflow condition persists over a line or frame boundary: one or multiple lines/frames are dropped. HW waits until one word becomes available in the PPI FIFO and inserts a data word with TAG FE. It then waits for the next FS to resume normal operation.

No specific SW intervention is required to recover synchronization and the HW ensures that no protocol violations or accesses outside of allocated buffers could occur.

NOTE: Optional MIPI CSI-2 LS and LE short packets are ignored by CAL. They are allowed in the datastream from the camera, but are not used and not forwarded to the CAL shared processing pipeline.

CAL does not have a specific mechanism to ignore CRC checking. SW must simply disable the CS_IRQ event. CAL does not discard data with invalid CRC.

10.4.6.3 CAL Data Stream Merger

Two possible sources (2 x PPI) can produce data that is sent through the shared CAL processing pipeline. The shared processing pipeline is time multiplexed at 64-bit word level. Data from the PPI interfaces cannot be stalled. It is therefore stored in a FIFO (per PPI) to compensate shared pipeline access latencies.

A fixed priority arbitration scheme is used when data is ready from multiple sources. PPI_0 source is with highest priority, after that PPI_1.

PPI FIFOs are only intended to compensate internal pipeline access latencies. It is SW responsibility to ensure that the total pixel rates are compatible with CAL capabilities.

10.4.6.4 CAL Pixel Extraction

Software must configure which CPORT a given pixel processing context must process, by setting the [CAL_PIX_PROC_i\[23:19\]](#) CPORT register bit-field to the CPORT ID. The operation to perform is defined by the [CAL_PIX_PROC_i\[4:1\]](#) EXTRACT bit-field.

The data of a CPORT is forwarded without modification when pixel processing is disabled for that CPORT.

The pixel extraction stage receives up to 64 bits per cycle and can output either 64 bits (bypass) or 4 samples (6 ~ 16 bits per sample; 1 sample = 1 pixel for RAW data) per cycle.

Extracted pixels are left padded with 0's to fill 16-bit containers (for example, for RAW10: out[15:10]=0's and out[9:0]=data)

It only processes data tagged as DAT_PIX_FS, DAT_PIX_LS, DAT_PIX, DAT_PIX_FE, and DAT_PIX_LE (see [Figure 10-9](#), *CAL Data Pipeline TAGs*, for definitions). All other data types are simply forwarded (that is, output = input).

DAT_PIX_FS and DAT_PIX_LS tags reset the pixel extraction state-machine. That ensures proper recovery in case the pixel decoder goes out of sync for some reason (for example, TxBuffer overflow in the transmitter, wrong configuration, bad synchronization between hardware and software).

Four samples do not necessarily align with a complete 64-bit word and several bits remain unused. They are stored locally until enough data is available to extract four additional samples or the end of a line has been reached (that is, TAG = PIX_DAT_LE or PIX_DAT_FE). The last 64-bit word can be padded with 0's, if there is not enough data to generate 4 pixels after all data tagged as PIX_DAT_LE or PIX_DAT_FE has been processed.

Contexts can be interleaved with 64-bit word granularity (that is, two consecutive words can have different TAGs).

The number of contexts is as defined in the [CAL_HL_HWINFO\[12:8\]](#) PCTX register bit-field

NOTE: The pixel extraction engine does not process the VQ (data validity qualifier) generated by the CSI-2 data packing stage. It forwards the VQ when bypass mode is selected and replaces it by VQ=0 (all data valid) when data expansion is performed.

The pixel extraction stage must be bypassed for JPEG data.

10.4.6.5 CAL DPCM Decoding and Encoding

The CAL DPCM decoder block only processes data tagged as DAT_PIX_FS, DAT_PIX_LS, DAT_PIX, DAT_PIX_LE and DAT_PIX_FE (as defined in [Figure 10-9, CAL Data Pipeline TAGs](#)). All other data types or data belonging to CPORTs where DPCM encode/decode is disabled, is simply forwarded. Software chooses which CPORT a given pixel processing context must process by setting the [CAL_PIX_PROC_i\[23:19\]](#) CPORT register bit-field to the CPORT ID. The DPCM decompression operation is selected through the [CAL_PIX_PROC_i\[9:5\]](#) DPCMD bit-field, and the DPCM compression operation is selected through the [CAL_PIX_PROC_i\[15:11\]](#) DPCME bit-field.

PIX_DAT_FS and PIX_DAT_LS tags initialize the DPCM encoder.

PIX_DAT_FS and PIX_DAT_LS tags initialize the DPCM decoder, except when the previous TAG received on that context was DPCM_INIT. DPCM_INIT copies the received word into the context status register of the DPCM decoder and discards the initialization word (that is, it is not forwarded to the next pipeline stage). The next word of four pixels received on that context is DPCM decoded and the usual initialization step is skipped. That feature is intended to enable DPCM decoding of an image in multiple vertical stripes without re-decoding each line from the beginning.

Table 10-17. CAL DPCM Formats

Codec	Predictor	Decode	Encode	Performance
10 - 8 - 10	Predictor 1	YES	YES	4 px/cyc
10 - 8 - 10	Predictor 2	-	-	-
10 - 7 - 10	Predictor 1	YES	-	4 px/cyc
10 - 7 - 10	Predictor 2	YES	-	1 px/cyc
10 - 6 - 10	Predictor 1	YES	-	4 px/cyc
10 - 6 - 10	Predictor 2	YES	-	1 px/cyc
12 - 8 - 12	Predictor 1	YES	YES	4 px/cyc
12 - 8 - 12	Predictor 2	-	-	-
12 - 7 - 12	Predictor 1	YES	-	4 px/cyc
12 - 7 - 12	Predictor 2	-	-	-
12 - 6 - 12	Predictor 1	YES	-	4 px/cyc
12 - 6 - 12	Predictor 2	-	-	-
14 - 10 - 14 ⁽¹⁾	Predictor 1	YES	YES	4 px/cyc
14 - 10 - 14	Predictor 2	-	-	-
14 - 8 - 14	Predictor 1	YES	YES	4 px/cyc
14 - 8 - 14	Predictor 2	-	-	-
16 - 12 - 16	Predictor 1	YES	YES	4 px/cyc
16 - 12 - 16	Predictor 2	-	-	-
16 - 10 - 16	Predictor 1	YES	YES	4 px/cyc
16 - 10 - 16	Predictor 2	-	-	-
16 - 8 - 16	Predictor 1	YES	YES	4 px/cyc
16 - 8 - 16	Predictor 2	-	-	-

⁽¹⁾ The WDR_DPCM_ENABLE eFuse must be enabled (CTRL_WKUP_STD_FUSE_CONF[27] CAL_WDCPM_DISABLE register bit = 0x0).

The DPCM encoder and decoder are independent. They preserve state for each of the pixel processing contexts (defined in [CAL_HL_HWINFO\[12:8\]](#) PCTX register bit-field), so that the encoder and the decoder context can be swapped with 4-pixel granularity.

The DPCM encoder and decoder can stall the incoming pixel from the pixel extraction block, if it arrives faster than what they can handle (that is, PREDICTOR2 selection or dataflow stalled by the pixel packing stage/Write DMA).

NOTE: The DPCM encoding/decoding stage must be bypassed for JPEG data.

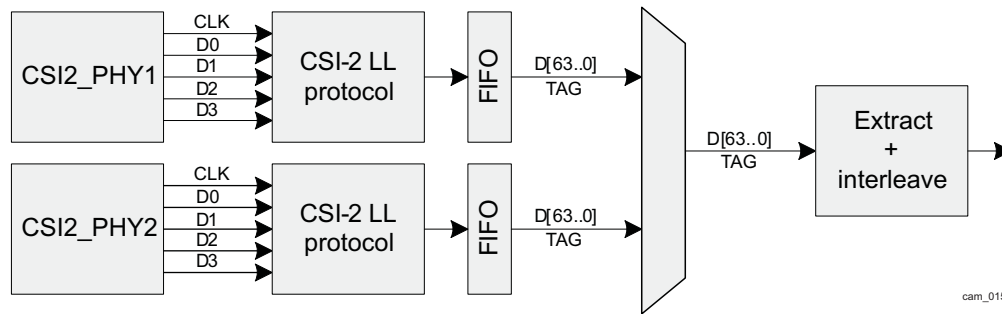

10.4.6.6 CAL Stream Interleaving

CAL supports interleaving at pixel level of data streams received from two cameras that are synchronized. These two cameras are typically CSI-2 cameras attached to the PPI_0 and PPI_1 interfaces.

In order to use the stream interleaving feature, `CAL_CTRL1[1:0] PPI_GROUPING` register bit-field must be set to `PPI_0` or `PPI_1`.

Figure 10-27 shows a physical view of the interleaving.

Figure 10-27. CAL PPI Interleaving - Physical View

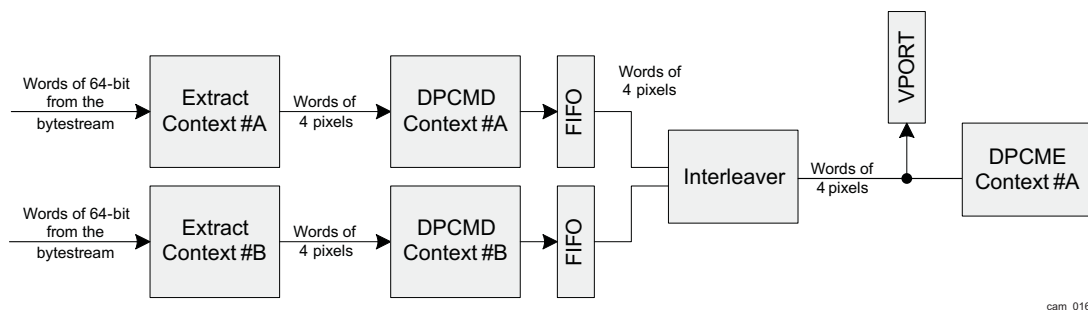

The actual interleaving is done after the DPCM decompression stage of the CAL processing pipeline and requires two linked pixel processing contexts. The interleaving feature is controlled by bit-fields [5:4] `INTERLEAVE23` and [3:2] `INTERLEAVE01` of the `CAL_CTRL1` register. CAL supports no interleaving, interleaving with 1 pixel granularity or interleaving with 4 pixel granularity.

Both PPI interfaces must be configured to forward the received bytestream to the internal processing pipeline using two separate CPORT IDs. The bytestream is then converted into words of 4 pixels by the two independent extraction contexts and DPCM decompressed. Up to this stage, the processing is identical to non interleaved mode.

Data generated by the two pixel processing contexts is stored in two small FIFOs when interleaving is enabled (that is, when bit-fields [5:4] `INTERLEAVE23` and [3:2] `INTERLEAVE01` of the `CAL_CTRL1` register are set to a value different than 0x0). Otherwise, the data is directly forwarded to the rest of the pipeline.

Figure 10-28 provides a logical view of a CAL stream interleaving.

Figure 10-28. CAL Stream Interleaving - Logical View

The interleaver reads blocks of 2 or 4 pixels from the 2 FIFOs (physically stored in 16-bit containers) and interleaves the data with 1 pixel or 4 pixel granularity. Figure 10-29 below shows when pixels are read from the respective FIFOs (the number in the cell is the pixel position)

Figure 10-29. CAL Interleave FIFO reads

CAL_CTRL1[] INTERLEAVExy = 1									CAL_CTRL1[] INTERLEAVExy = 2								
CYC	Read from FIFO0			Read from FIFO1					CYC	Read from FIFO0			Read from FIFO1

cam_016

The datastream uses the pixel processing context #0 and its CPORT ID after interleaving.

NOTE: Bit-fields [5:4] INTERLEAVE23 and [3:2] INTERLEAVE01 of the CAL_CTRL1 register must not be changed when the pixel processing contexts 0 or 1 are processing data.

Interleaving is not supported for JPEG data. Bit-fields [5:4] INTERLEAVE23 and [3:2] INTERLEAVE01 must be set to 0x0 for JPEG data.

The stream sizes on both PPI_0 and PPI_1 are expected to be equal. However, if they are not, CAL will forward data from the longer stream without interleaving.

The PPI context IDs of interleaved streams must match. Therefore, it is possible to interleave context #0 from PPI_0 with context #0 from PPI_1. But it is not possible to interleave context #0 from PPI_0 with context #1 from PPI_1.

10.4.6.7 CAL Pixel Packing

Software selects which CPORT a given pixel processing context must process by setting the CAL_PIX_PROC_i[23:19] CPORT bit field to the CPORT ID. The operation to perform is defined by the CAL_PIX_PROC_i[18:16] PACK bit field.

The pixel packing stage only processes data tagged as PIX_DAT_FS, PIX_DAT_LS, PIX_DAT, PIX_DAT_FE and PIX_DAT_LE. All other data types or data belonging to a CPORT where pixel packing is disabled is simply forwarded. The packing stage is reset by PIX_DAT_FS and PIX_DAT_LS to recover synchronization in case it has been lost.

The pixel packing stage is flushed by a PIX_DAT_FE, PIX_DAT_LE and PIX_DAT_LE TAG: the last generated 64-bit word may be padded with 0's

Pixel packing is a symmetrical processing step to the pixel extraction (see [Section 10.4.6.4, CAL Pixel Extraction](#)). However, the list of supported formats is different. The pixel packing stage also has buffering to preserve temporary (that is, incomplete) data when contexts are switched.

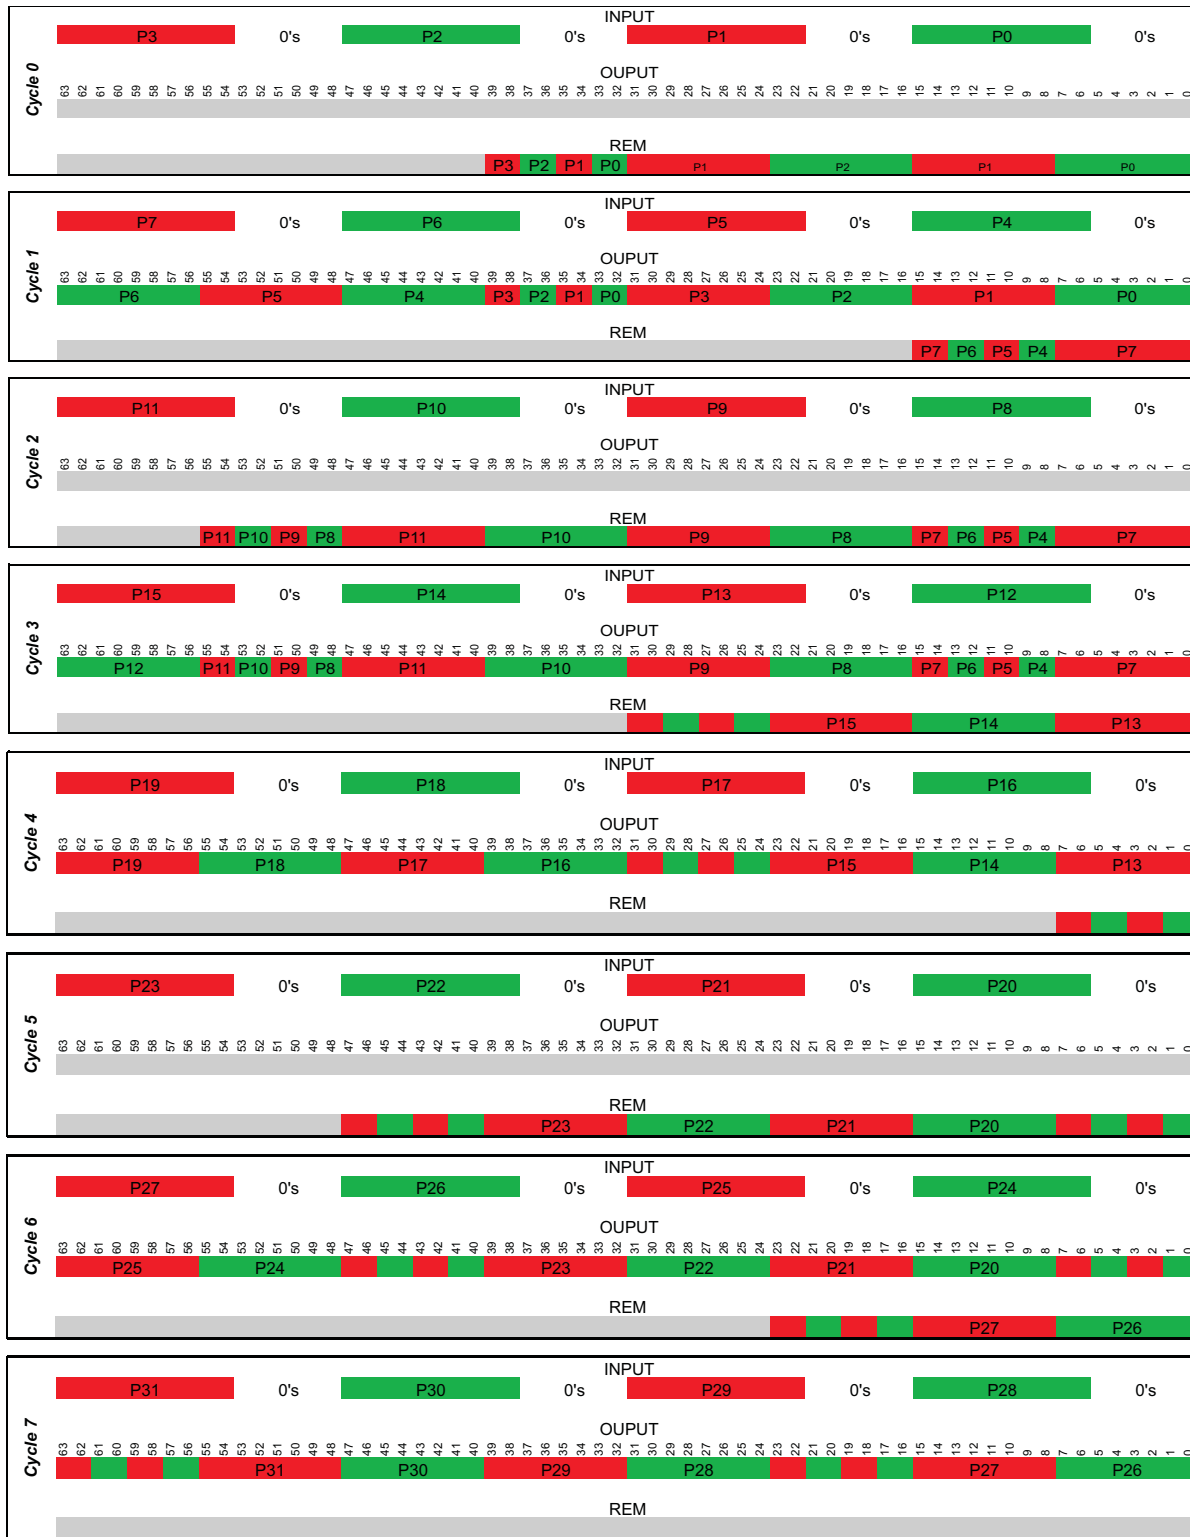

Supported packing modes are:

- RAW8 (8 bits per pixel)
- RAW10 (MIPI) (10 bits per pixel)
- RAW12 (linear) (12 bits per pixel)
- RAW12 (MIPI) (12 bits per pixel)
- RAW16 (16 bits per pixel)
- ARGB (32 bits per pixel)

The pixel packing engine does not process the VQ (data validity qualifier) generated by the CSI-2 data packing stage. It forwards the VQ when bypass mode is selected and replaces it by VQ=0 (all data valid) when data expansion is performed.

[Figure 10-31](#) shows how the packing engine packs 32 consecutive pixels (equal to 8 active input cycles as 4 pixels are provided per cycle) into five 64-bit words ready to be sent to memory (REM).

Figure 10-31. CAL MIPI RAW10 Data Packing

camcsi3-011

Figure 10-32 shows how the packing engine packs consecutive pixels (Px corresponds to a 16-bit pixel in the internal pipeline) into 64-bit words.

10.4.6.8 CAL Write DMA

10.4.6.8.1 CAL Write DMA Overview

The memory Write DMA has WCTX (defined in [CAL_HL_HWINFO\[18:13\]](#) WCTX register bit-field) independent write contexts (that is, logical DMA channels). Each context receives a byte stream over a 64-bit wide bus as well as the TAG.

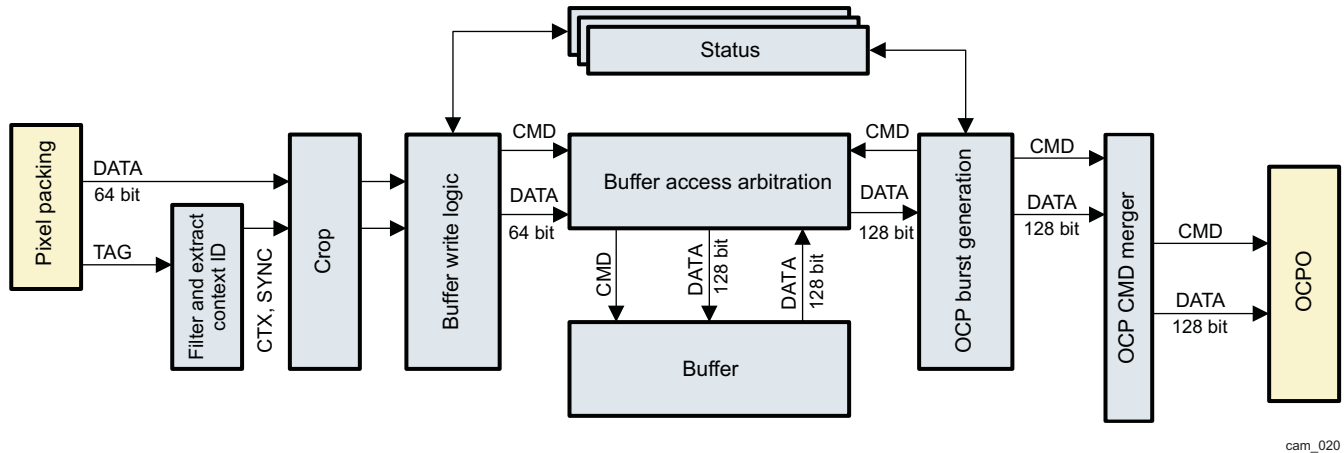

The Write DMA filters incoming data using the CPORT number and data type contained in the TAG. Data is only processed, if it matches the CPORT number defined in the [CAL_WR_DMA_CTRL_k\[13:9\]](#) CPORT register bit-field and the data type defined in the [CAL_WR_DMA_CTRL_k\[8:6\]](#) DTAG bit-field. It also uses the received TAG to lookup the adequate context information and control the address generation logic.

Only one write context can process a given data word from the internal pipeline at the time. Said differently, the Write DMA cannot be used to write two copies of the same data into separate locations. Software must prevent that two active write contexts have the same settings for `CAL_WR_DMA_CTRL_k[13:9]` CPORT and `CAL_WR_DMA_CTRL_k[8:6]` DTAG bit-fields.

Data that is not processed by the Write DMA is discarded. Since the Write DMA is the last stage in the CAL processing pipeline, it cannot forward data to a next stage.

Figure 10-33 shows a simplified block diagram of the Write DMA engine.

Figure 10-33. CAL Pixel Packing – Data Storage in Memory

cam_020

10.4.6.8.2 CAL Write DMA Data Cropping

SW can limit the maximum number of lines (defined in `CAL_WR_DMA_CTRL_k[31:18]` YSIZE register bit-field) to be written into memory for pixel formats (for which line start/end codes are provided). By default, all received lines are written to memory (when the value of `[31:18]` YSIZE = 0x0000). This feature is typically used to prevent writes outside of the allocated SDRAM buffer even when CAL and the external data transmitter get out of sync (for example, due to EMI on the link).

It is possible also SW to discard part of the received data for pixel and attribute data (that is, header and control data cannot be discarded). This is performed inside the Write DMA cropping block. The feature is enabled by configuring:

- The position of the 1st byte to preserve in each line in the `CAL_WR_DMA_XSIZE_k[15:3]` XSKIP register bit-field
- The number of bytes to preserve for each line in the `CAL_WR_DMA_XSIZE_k[31:19]` XSIZE bit-field

The cropping block discards unwanted data and modifies data TAG to preserve integrity. For example, when pixel data is processed:

- PIX_DAT_FS => 1st word of a frame
- PIX_DAT_LS => 1st word of a line, except for the 1st line
- PIX_DAT_LE => last word of a line, except for the last line
- PIX_DAT_FE => last word of a frame
- PIX_DAT => any other pixel data

Cropping is mainly intended to reduce storage requirements / power consumption when digital zoom is used. No dummy data will be written, if the programmed size is less than what is received.

Cropping may also be used for attribute data. It cannot be used for header data. It is SW responsibility to not use cropping for header data. HW does not perform any additional checks.

The Write DMA accumulates data independently for contexts until an OCP write transaction can be generated. That is the case when enough data is available to generate a full burst or when the end of an image line has been reached.

NOTE: Data cropping is performed after the DPCM encoder. Therefore, horizontal skipping cannot be used when data is DPCM encoded. Otherwise, it will be not possible to decode the data, unless reference samples have been stored to resume decode.

Cropping must be disabled for JPEG data.

10.4.6.8.3 CAL Write DMA YUV422 to YUV422BP Conversion

The Write DMA block can convert data in YUV422 format into YUV422BP format. The BP refers to "Bi-Planer", where Y and UV are split out onto two separate DMA channels (CAL does not perform the decimation). The format conversion to YUV422BP, when enabled, takes place after the cropping stage.

SW must program two adjacent Write DMA contexts for the YUV422BP conversion. The Y channel is always an even numbered context, while the UV channel is the next context (that is, Y is context #0 and UV is context #1). The Y context is the dominant and the UV is the slave. The YUV422BP register bits are set for both channels/contexts. Both Write DMA channels shall be programmed identically except for the destination address. Even the `CAL_WR_DMA_CTRL_k[2:0]` MODE register bit-field should be programmed identically for both channels. Internally, the slave channel will be disabled from capturing data from its programmed context and will rather accept the UV portion of the data from the dominant channel.

Only YUV422 data format can be converted to YUV422BP and it is the SW responsibility to program upstream modules of CAL to supply YUV422 data for conversion. True YUV420 format would decimate every other line of UV extracted from the YUV422, but CAL does not perform this aspect of the operation.

Internally, the YUV422BP conversion is using pairs of YUV422 bus transactions and separating out Y and UV portions. It then re-inserts these reformed data phases on the internal bus to the Write DMA assigning context n to the Y data and context n+1 to the UV data. The Write DMA treats these Y and UV data streams as two independent contexts. Up stream of the YUV422BP conversion, the CAL treats it as a single context.

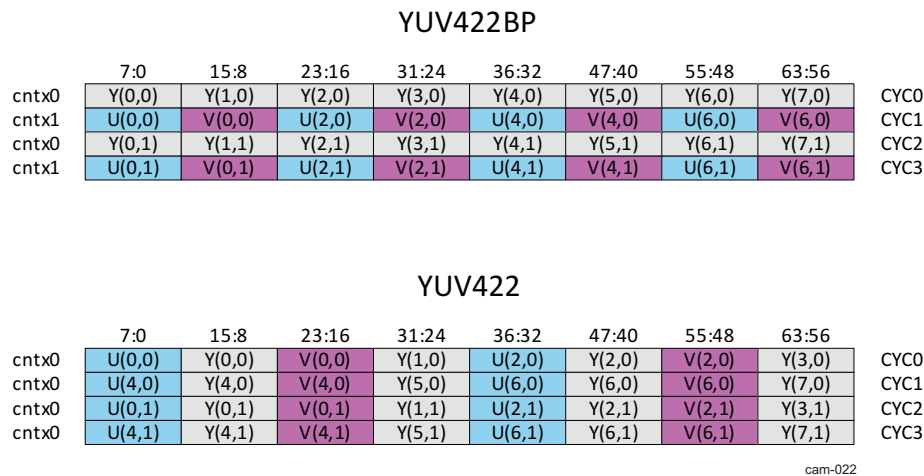

Figure 10-34. CAL YUV422 to YUV422BP Conversion (Internal Bus Format)

The DMA module extracts the two different contexts from the internal bus to the Write DMA module. As it does with other formats, it packs the data into a buffer per DMA context and writes this out onto the OCP bus once sufficient data is available for an efficient DMA burst.

The following DMA limitations apply to the YUV422BP conversion:

- Image lines less than 16 pixels are not supported.
- Filter/Cropping shall only be performed on (n x 2) pixel boundaries
- When CIRC_MODE is used, it shall be set identically for both Y and UV channels in the `CAL_WR_DMA_OFST_k` register. This means that both channels shall either be CIRC_MODE or not, and when in CIRC_MODE they are programmed for the same circular terminal count.

- YUV422BP format is supported only for PIX_DAT. It is not supported for ATT_DAT, ATT_HDR, CTRL_HDR, PIX HDR.
- YUV422BP Y context can only be assigned to Even Context (that is, 0, 2, 4, 6).
- YUV422BP UV context must be the next context (that is, for example, if Y context is 2, then UV context is 3).
- Since YUV422BP consumes two DMA channels per CSI2 channel, the overall channel count is degraded by a factor of 2 (that is, maximum of four YUV422BP channels is simultaneously supported).
- JPEG is not supported for YUV422BP conversion.

10.4.6.8.4 CAL Write DMA Buffer Management

The DMA write buffer has two functions:

- Accumulate enough data to issue efficient OCP transactions
- Buffer data when it cannot be written to the OCPO port

Different write contexts do not have fixed locations in the write buffer to optimize the required buffer size. In fact, at a given point of time only some of the contexts are active while others are idle. There is no reserved space for unused contexts. Also, different contexts have different bandwidth requirements. Therefore, different amounts of data will pile up for different contexts when OCPO is stalled.

The buffer is divided into slots of $2^{(WDMA_SLOTSIZE+7)}$ bytes that are dynamically allocated to a context. CAL maintains some internal status information to manage the buffer:

- For each slot:
 - State (2 bits):
 - Empty
 - Open (ready to receive more data)
 - Closed (does not accept new data; ready for OCP burst generation)
 - Level (4 bits): amount of data currently stored in the data slot
 - Cleared when data has been sent to OCPO
 - Incremented by 8 bytes each time a new word of 64-bits is added
 - Destination Address (29 bits): destination address for an OCP burst
 - This value is computed when the 1st word of 64-bits is stored in the slot
 - All data of the slot is stored contiguously in memory. The HW allocates new slots to skip memory locations at line ends.
- For each context
 - Slot current in use (if applicable)
 - Destination address

The Write DMA uses the data qualifier provided along with data words to pack data in the local working memory. It has a barrel shifter to pack data when lines ends do not correspond to 64-bit word boundaries and `CAL_CSI2_CTXy_I[14] PACK_MODE = 0x1` (Frame mode).

OCP bursts cannot span over multiple slots for design simplification. Refer to section OCP Transaction Generation for more details.

10.4.6.8.5 CAL Write DMA OCP Address Generation

NOTE: CAL can perform TILER view memory access by configuring `CTRL_CORE_SEC_EFUSE_SMA_SW_3[30] CAL_TILED_MEMORY_SPACE` register bit. For more details, refer to [Section 2.2, L3_MAIN Memory Map](#), and [Chapter 20, Control Module](#).

10.4.6.8.5.1 Write DMA Buffer Base Address

The buffer base address (referred to as BASE, internal variable that cannot be read by SW) is automatically updated when an ATT_HDR_S, ATT_DAT_S, CTRL_HDR_S, PIX_HDR_S or PIX_DAT_FS is received by the Write DMA using the following algorithm based around [CAL_WR_DMA_CTRL_k\[2:0\]](#) MODE register bit-field:

- MODE = 0x0 (Disable): DMA is disabled
- MODE = 0x1 (Ping/pong destination address on every frame):
 - BASE = [CAL_WR_DMA_ADDR_k](#)
 - [CAL_WR_DMA_ADDR_k](#) = CAL_WR_DMA_ADDR_OLD
 - CAL_WR_DMA_ADDR_OLD = BASE
- MODE = 0x3 (Initialize start address for continuous mode. The first frame will be written at this address and consecutive frames will be appended):
 - BASE = [CAL_WR_DMA_ADDR_k](#)
 - [CAL_WR_DMA_ADDR_k](#) = CAL_WR_DMA_ADDR_OLD
 - CAL_WR_DMA_ADDR_OLD = LINE_START (See [Section 10.4.6.8.5.2, Write DMA Line Start Address](#), for further details)
 - [CAL_WR_DMA_CTRL_k\[2:0\]](#) MODE = 0x2
- MODE = 0x2 (Continuously write data to memory):
 - BASE = LINE_START + [CAL_WR_DMA_OFST_k](#)
- MODE = 0x4 (Use [CAL_WR_DMA_ADDR_k](#) as base address)
 - BASE = [CAL_WR_DMA_ADDR_k](#)

After reset, CAL_WR_DMA_ADDR_OLD = 0x00000000. Software must update the [CAL_WR_DMA_ADDR_k](#) register after the first FE event with a valid destination address. Otherwise, data will be sent to address 0 which is typically not a valid destination.

10.4.6.8.5.2 Write DMA Line Start Address

The line start address is set to the base address when the base address is updated (that is, LINE_NUMBER = 0 at frame start). Otherwise, the line start address is updated upon reception of the PIX_DAT_LS tag depending on the [CAL_WR_DMA_OFST_k\[23:22\]](#) CIRC_MODE register bit-field and [CAL_WR_DMA_CTRL_k\[4:3\]](#) WR_PATTERN bit-field. [Table 10-18](#) summarizes how the line start address (LINE_START) and line numbers are updated on every PIX_DAT_LS tag.

Table 10-18. Write DMA - Line Start Address Computation

CAL_WR_DMA_OFST_k[23:22] CIRC_MODE	CAL_WR_DMA_CTRL_k[4:3] WR_PATTERN	Description
0 (Disabled)	0 (Linear)	Linear buffer $LINE_N = LINE_N + 1$ $LINE_START = LINE_START + \text{CAL_WR_DMA_OFST_k}[18:4] \text{ OFST}$
0 (Disabled)	2 (Write 2 lines, skip 2 lines)	Linear buffer + skip pattern if $LINE_N \#2 == 0$: $LINE_N = LINE_N + 1$ $LINE_START = LINE_START + \text{CAL_WR_DMA_OFST_k}[18:4] \text{ OFST}$ else: $LINE_N = LINE_N + 3$ $LINE_START = LINE_START + 3 * \text{CAL_WR_DMA_OFST_k}[18:4] \text{ OFST}$
0 (Disabled)	3 (Write 2 lines, skip 4 lines)	Linear buffer + skip pattern if $LINE_N \#2 == 0$: $LINE_N = LINE_N + 1$ $LINE_START = LINE_START + \text{CAL_WR_DMA_OFST_k}[18:4] \text{ OFST}$ else: $LINE_N = LINE_N + 5$ $LINE_START = LINE_START + 5 * \text{CAL_WR_DMA_OFST_k}[18:4] \text{ OFST}$

Table 10-18. Write DMA - Line Start Address Computation (continued)

CAL_WR_DMA_OFST_k [23:22] CIRC_MODE	CAL_WR_DMA_CTRL_k [4:3] WR_PATTERN	Description
1 (1 Line) 2 (4 Lines) 3 (64 Lines)	0 (Linear)	Circular buffer if CIRC_MODE == 1: G = 1 elif CIRC_MODE == 2: G = 4 else: G = 64 if LINE_N == G * CAL_WR_DMA_OFST_k[31:24] CIRC_SIZE: LINE_N = 0 LINE_START = BASE else: LINE_N = LINE_N + 1 LINE_START = LINE_START + CAL_WR_DMA_OFST_k[18:4] OFST
different than 0	different than 0	Reserved. Do not use this combination.

NOTE: CAL_WR_DMA_CTRL_k[2:0] MODE must be set to 0x0 (disabled) or 0x4 (use CAL_WR_DMA_ADDR_k as base address), when CAL_WR_DMA_OFST_k[23:22] CIRC_MODE != 0.

10.4.6.8.5.3 Write DMA Data Address

Data received together with the ATT_HDR_S, ATT_DAT_S, CTRL_HDR_S, PIX_HDR_S, PIX_DAT_FS or PIX_DAT_LS tag is stored at the line start address (refer to section Line Start Address). For all other tags (ATT_HDR_E, ATT_DAT, ATT_DAT_E, PIX_HDR_E, CTRL_HDR_E, PIX_DAT, PIX_DAT_FE or PIX_DAT_LE), data is appended (that is, ADDR+ = 8, for each word of 64-bits).

Figure 10-35 illustrates how data is stored in memory when CAL_WR_DMA_OFST_k[23:22] CIRC_MODE = 0 (disabled) and CAL_WR_DMA_CTRL_k[4:3] WR_PATTERN = 0 (linear).

Figure 10-35. Write DMA - Framing

cam_021

The Write DMA channel with the lowest ID has the highest priority when multiple channels are ready to send data simultaneously.

Software can use CAL_WR_DMA_XSIZE_k[31:19] XSIZE = 0 in case the stream size is not known or exceeds the maximum range of the XSIZE bitfield. CAL skips the cropping feature in that case and sends all data to memory. However, software must still ensure that enough memory space has been allocated.

10.4.6.8.6 CAL Write DMA OCP Transaction Generation

The Write DMA generates OCP write bursts of 1~8 x 16 bytes. A burst never crosses a 128 byte boundary. The maximum burst size is defined by the [CAL_CTRL\[6:5\] BURSTSIZE](#) register bit-field. The first and the last burst of a contiguous data block may use smaller burst sizes than defined in the BURSTSIZE bit-field. Bursts in the middle of the data block must use exactly the size defined in the BURSTSIZE bit-field.

10.4.6.8.7 CAL Write DMA Real Time Traffic

Traffic for which the pixel rate is imposed by the camera is qualified as hard real time traffic. Example of such hard real time traffic is data received from the camera (through PPI), optionally processed in the CAL and then sent to SDRAM using the OCPO port.

Hard real time traffic cannot be stalled for long periods of time. Indeed, the camera sends data at constant speed and it can only be stalled until FIFOs on the path are filled up. When FIFOs become full, data is discarded and the frame is therefore corrupted. To minimize the risk of real time data corruption, the device supports a mechanism that is activated by the MFlag generated by real time initiators.

MFlag generation must be disabled (through [CAL_CTRL\[20:13\] MFLAGL = 0xFF](#) and [CAL_CTRL\[31:24\] MFLAGH = 0xFF](#)), when CAL does not generate any real time traffic.

Static assertion of MFlag is only supported for debug purposes and must not be enabled for normal utilization ([CAL_CTRL\[20:13\] MFLAGL = 0x00](#) -> MFlag=0x11; [CAL_CTRL\[20:13\] MFLAGL = 0xFF](#) and [CAL_CTRL\[30:24\] MFLAGH = 0x00](#) -> MFlag=0x01).

Dynamic MFlag generation is to be used when the Write DMA operates on real time data. In that case, the MFlag value depends on the number of slots (n) ready to generate transactions in the Write DMA:

- MFlag = 00: SAFE ($n < \text{CAL_CTRL}[20:13] \text{MFLAGL}$)
- MFlag = 01: VULNERABLE ($\text{CAL_CTRL}[20:13] \text{MFLAGL} \leq n < \text{CAL_CTRL}[31:24] \text{MFLAGH}$)
- MFlag = 11: ENDANGERED ($\text{CAL_CTRL}[30:24] \text{MFLAGH} \leq n$)

Software must ensure that:

- [CAL_CTRL\[20:13\] MFLAGL](#) \leq [CAL_CTRL\[30:24\] MFLAGH](#) (only 0x00 or 0x11 generated, when MFLAGL = MFLAGH)
- [CAL_CTRL\[20:13\] MFLAGL](#) = 0x00, 0xFF or less or equal to $2^{(\text{CAL_HL_HWINFO}[3:0] \text{WFIFO} - 3)}$
- [CAL_CTRL\[30:24\] MFLAGH](#) = 0x00, 0xFF or less or equal to $2^{(\text{CAL_HL_HWINFO}[3:0] \text{WFIFO} - 3)}$

10.4.6.9 CAL Video Port

10.4.6.9.1 CAL Video Port Overview

[Figure 10-36](#) shows the CAL video port internal architecture. It is composed of a timing generator and a FIFO. All four video ports have same architecture and take same register inputs.

The video port receives data + TAGs from the DPCM decoder stage. It filters the received data and only processes:

- Data that matches the CPORT ID defined by the [CAL_VPORT_CTRL2\[4:0\] CPORT](#) register bit-field
- Data that is tagged as PIX_DAT_FS, PIX_DAT_LS, PIX_DAT, PIX_DAT_LE or PIX_DAT_FE

In addition, it uses the FE_CODE tag to enter the vertical blanking period after the end of the horizontal blanking period when the vertical blanking period is not already started.

Other data is ignored by the video port (this does not affect the operation of other pipeline stages).

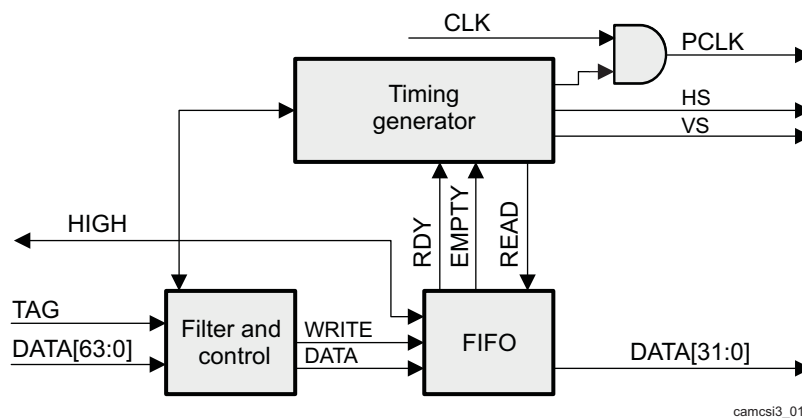

NOTE: Only one CPORT can use the video port and only pixel data can be sent to the video port (that is, control and attribute packets are ignored).

When the video port is configured in baseline mode (CTRL_CORE_SMA_SW_3[31] CAL_BASELINE_EN = 0x1), then only one CPORT can use Video Port 1 and only pixel data can be sent to Video Port 1 (that is, control and attribute packets are ignored).

When the video port is configured in VPx4 mode (CTRL_CORE_SMA_SW_3[31] CAL_BASELINE_EN = 0x0), then the video ports mapping is as follows:

- VP1: CAL_VPORT_CTRL2[4:0] CPORT
- VP2: CAL_VPORT_CTRL2[4:0] CPORT + 1
- VP3: CAL_VPORT_CTRL2[4:0] CPORT + 2
- VP4: CAL_VPORT_CTRL2[4:0] CPORT + 3

Figure 10-36. CAL Video Port and Timing Generator

The FIFO receives data from the internal processing pipeline at a variable rate (up to 4 pixels per cycle). The HIGH signal is asserted a few cycles before the FIFO becomes full. It is used to stall the incoming pixel flow. Therefore, no FIFO overflow can occur.

The timing generator is started after a PIX_DAT_FS tag, when the FIFO level exceeds the threshold defined in CAL_VPORT_CTRL2[31:18] RDY_THR bit field. This threshold is 0 by default but may be used to smooth the traffic on the video port.

The timing generator controls pixel reads from the FIFO. It only reads a pixel when:

- The current output position corresponds to an active location.
- Data is ready in the FIFO.

10.4.6.9.2 CAL Video Port Pixel Clock Generation

The video port pixel clock (VP_PCLK) is generated from the functional clock (CAL_FCLK). Software sets the peak pixel rate using the CAL_VPORT_CTRL1[16:0] PCLK register bit-field. The pixel rate is automatically controlled by the hardware, when data arrives from the RD_DMA.

The mean pixel clock rate on the video port can be given with the equation:

$$VP_PCLK = CAL_FCLK \times CAL_VPORT_CTRL1[16:0] PCLK / 65536$$

As VP_PCLK is generated from the CAL functional clock, some clock pulses are gated to reach the selected frequency. The following algorithm is used to generate the internal PCLK_EN signal:

1. ACC = CAL_VPORT_CTRL1[16:0] PCLK
2. If (ACC + CAL_VPORT_CTRL1[16:0] PCLK >= 65536) then PCLK_EN=1 else PCLK_EN=0
3. ACC = (ACC + CAL_VPORT_CTRL1[16:0] PCLK) % 65536
4. Go back to step #2

The configured pixel clock is used for active as well as for blanking periods.

10.4.6.9.3 CAL Video Port Video Timing Generator

The timing generator state-machine reuses the synchronization information received through TAGs to:

- Control state transitions
- Assert the VP_HS and VP_VS signals
- Detect when data is ready to be sent

For more details on the video port, refer to [Section 10.3.2, CAL Integration - Video Port](#).

The timing generator can be unconditionally reset in the following ways:

- A general hardware (by CAL_RST signal) or software (through the [CAL_HL_SYSCONFIG\[0\] SOFTRESET](#) register bit) reset
- Setting the [CAL_VPORT_CTRL2\[17\] FSM_RESET](#) bit

It is also reset by data tagged as PIX_DAT_FS when the [CAL_VPORT_CTRL2\[16\] FS_RESETS](#) bit is set. This bit is enabled by default, but may be disabled when vertical blanking times are very short and there is no risk of TX data dropping/desynchronizing.

Four VP_PCLK cycles are sent before the first active pixel. The video port state-machine then waits until four VP_PCLK cycles are sent after the last blanking cycle of the frame.

Active data is sent to the video port only when at least $4 \times$ [CAL_VPORT_CTRL2\[31:18\] RDY_THR](#) pixels are available. That mechanism can be used to smooth the pixel rate on the video port, if input data arrives at bursty rate. The video port FIFO accumulates $4 \times$ [CAL_VPORT_CTRL2\[31:18\] RDY_THR](#) after frame start before it sends the first pixel, and signal VP_VS = VP_HS = 1.

The video port can generate horizontal and vertical blanking in addition to pixels received from the CAL pipeline. The amount of blanking is defined by the [CAL_VPORT_CTRL1\[24:17\] XBLK](#) and [CAL_VPORT_CTRL1\[30:25\] YBLK](#) bit fields. The pixel clock is active at the chosen speed during blanking. VP_HS pulses are provided during vertical blanking. The pixel clock is cut during the idle period.

The timing generator is stalled (VP_PCLK = 0, state-machine stalled) when the current position is in the active video region (waiting for data), but no data is available. VP_PCLK is free running (at the speed defined by [CAL_VPORT_CTRL1\[16:0\] PCLK](#) bit-field) during horizontal and vertical blanking periods. No line PIX_DAT_HS, PIX_DAT_HE, PIX_DAT_VS, PIX_DAT_VE tags are expected by the video port state-machine during blanking periods.

NOTE: Software does not need to configure the size of the image for the video port. This information is extracted from the received datastream. Generally, to generate the vertical blanking, CAL counts the number of active pixels from the last image line.

The VP_VE signal is not generated when data comes from PPI interfaces, and no line or a too large number of lines have been configured in the [CAL_CSI2_CTXy_\[29:16\] LINES](#) register bit-field. However, the PPI provides the FE_CODE tag when the FE short packet is received from the camera. The state machine enters into vertical blanking generation mode upon reception, in case of this tag (if it is not already in vertical blanking mode: in that case it has no effect).

10.4.6.10 CAL Registers Shadowing

[Table 10-19](#) summarizes which CAL registers are shadowed.

Table 10-19. CAL Registers Shadowing

Register	Shadowed	Trigger	Additional Information
CAL_HL_REVISION	No	N/A	
CAL_HL_HWINFO	No	N/A	
CAL_HL_SYSCONFIG	No	N/A	
CAL_HL_IRQ_EOI	No	N/A	
CAL_HL_IRQSTATUS_RAW_j	No	N/A	

Table 10-19. CAL Registers Shadowing (continued)

Register	Shadowed	Trigger	Additional Information
CAL_HL_IRQSTATUS_j	No	N/A	
CAL_HL_IRQENABLE_SET_j	No	N/A	
CAL_HL_IRQENABLE_CLR_j	No	N/A	
CAL_PIX_PROC_j[0] EN	Yes	FS @ pixel processing input	Format received on CPORT may change (for example between viewfinder and full frame). However, utilization of separate CPORTs is preferred (if camera sensor permits).
CAL_PIX_PROC_j other bits	No	N/A	Use separate contexts and EN bits, if pixel processing for a given CPORT must be changed on a frame by frame basis
CAL_CTRL	No	N/A	Typically not changed while there is active traffic
CAL_LINE_NUMBER_EVT	No	N/A	
CAL_VPORT_CTRL1	Yes	FS @ video port input	Blanking / PCLK settings may need to be changed on each frame; for example when binning / digital zoom settings change.
CAL_VPORT_CTRL2[j] FSRESET bit	No	N/A	Control bit for debug only
CAL_VPORT_CTRL2 other bits	Yes	FS @ video port input	Pixel rate and source CPORT may need to change on the fly (that is, switch between camera modes that use separate CPORTs)
CAL_RD_DMA_CTRL	No	N/A	One-shot-operation only
CAL_RD_DMA_PIX_ADDR	No	N/A	One-shot-operation only
CAL_RD_DMA_PIX_OFST	No	N/A	One-shot-operation only
CAL_RD_DMA_XSIZE	No	N/A	One-shot-operation only
CAL_RD_DMA_YSIZE	No	N/A	One-shot-operation only
CAL_RD_DMA_INIT_ADDR	No	N/A	One-shot-operation only
CAL_RD_DMA_INIT_OFST	No	N/A	One-shot-operation only
CAL_WR_DMA_CTRL_k[1:0] MODE	Yes	FS @ CPORT = CAL_WR_DMA_CTRL_k[13:9] CPORT	Resolution may change for a given CPORT. That is not preferred but some sensors may require this mode.
CAL_WR_DMA_CTRL_k other bits	No	N/A	Use separate contexts and MODE bits, if size changes for a given CPORT.
CAL_WR_DMA_ADDR_k	Yes	FS @ CPORT = CAL_WR_DMA_CTRL_k[13:9] CPORT	Output is typically double buffered so that CAL writes one buffer when the other buffer is read.

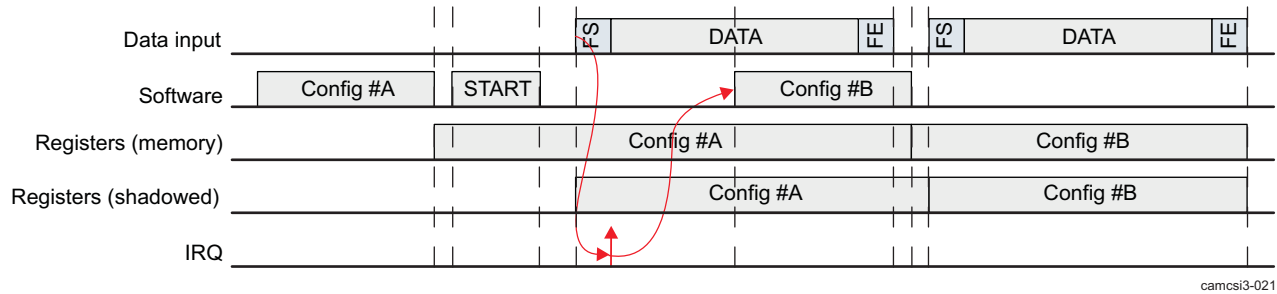

NOTE: Registers that are not shadowed are busy writable. Changes are immediately taken into account and may cause failure, if they are done while the hardware is using the register (that is, outside of the blanking periods).

For all shadowed registers, except [CAL_WR_DMA_ADDR_k](#), the content of the shadowed register is copied into the internal copy when the FS of the newly enabled stream is received by the corresponding engine. Said differently, new settings are taken into account just before they are needed. That maximizes time available to the software to change register settings. In particular, the first received FS copies initial settings into a shadow register.

The FS event is detected at the location in the pipeline where the setting applies. Said differently, the copy from shadow to working register does not occur exactly at the same time in all pipeline stages and there is no risk that the shadowing mechanism is activated too late or too early.

Figure 10-37 shows an example. Software writes configuration #A and then starts the processing step. The value from the configuration register is copied into the shadowed register that is used by hardware when the PIX_DAT_FS tag is received by relevant pipeline stage. Software may use an IRQ to detect the frame start and provide the settings for the next frame. The frame start interrupt is triggered by the low-level protocol. This happens up to 8 cycles before the PIX_DAT_FS tag reaches the processing stage. Therefore, software must ensure that there is a delay of at least 8 functional clock cycles from the FS_IRQ to the configuration update. In a real world case, this delay is ensured by the IRQ controller plus software latency. Software must first read the [CAL_HL_IRQSTATUS_j](#) registers to detect which event has triggered the IRQ before it can update configuration registers.

Figure 10-37. CAL Registers Shadowing Example

camcsi3-021

The [CAL_WR_DMA_ADDR_k](#) register has a specific shadowing to avoid that multibuffer management is on the critical software path. For more details, see [Section 10.4.6.8.5, Write DMA OCP Address Generation](#).

10.5 CAMSS Register Manual

NOTE: CAL and CSI2_PHY support is device part number dependent. Refer to a device-specific Data Manual, for more information.

10.5.1 CAMSS Instance Summary

Table 10-20 summarizes the CAMSS instances.

Table 10-20. CAMSS Instance Summary

Module Name	L4_PER3 Base Address	Size
CAL	0x489B 0000	1 KiB
CAMERARX_CORE_0	0x489B 0800	64 bytes
CAMERARX_CORE_1	0x489B 0900	64 bytes

NOTE: CAMERARX_CORE_0 is for CSI2_PHY1.
CAMERARX_CORE_1 is for CSI2_PHY2.

10.5.2 CAL Registers

NOTE: BYS, RD DMA, ICM and CSI-3 features are available on CAL module level, but not supported on device level.

10.5.2.1 CAL Register Summary

CAMSS Register Manual	<ul style="list-style-type: none"> CAL Register Summary: [2]

Table 10-24. CAL_HL_HWINFO

Address Offset	0x0000 0004	Instance	CAL
Physical Address	0x489B 0004		
Description	Information about the IP module's hardware configuration, i.e. typically the module's HDL generics (if any). Actual field format and encoding is up to the module's designer to decide.		

Table 10-24. CAL_HL_HWINFO (continued)

Type		R																													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NPPI_CONTEXTS1		NPPI_CONTEXTS0		NCPORT				VFIFO				WCTX				PCTX				RFIFO				WFIFO							

Bits	Field Name	Description	Type	Reset
31:30	NPPI_CONTEXTS1	Number of contexts for PPI interface #0 Read 0x3: Read 0x2: PPI interface supported with 8 contexts Read 0x1: PPI interface supported with 4 contexts Read 0x0: PPI interface not supported	R	0x2
29:28	NPPI_CONTEXTS0	Number of contexts for PPI interface #0 Read 0x3: Read 0x2: PPI interface supported with 8 contexts Read 0x1: PPI interface supported with 4 contexts Read 0x0: PPI interface not supported	R	0x2
27:23	NCPORT	Number of supported CPORTs (including CPORT #0) minus 1. That number typically corresponds to the number of CPORTs that can provide data from OCPI. E.g. NCPORT=7 means that CAL implements 8 CPorts but one of them (CPORT0) is typically used for data read from memory and typically 7 (CPORT1~CPORT7) can be used for data received on OCPI Note: Equals NCPORT generic parameter minus 1	R	0x07
22:19	VFIFO	Video port FIFO size	R	0x9
18:13	WCTX	Number of implemented DMA write contexts	R	0x08
12:8	PCTX	Number of implemented pixel processing contexts	R	0x04
7:4	RFIFO	Read FIFO size 2 ^{RFIFO} words of 16 bytes	R	0x6
3:0	WFIFO	Write FIFO size 2 ^{WFIFO} words of 16 bytes	R	0x9

Table 10-40. CAL_CTRL

Address Offset	0x0000 0100	Instance	CAL
Physical Address	0x489B 0100		
Description	Global control register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MFLAGH								RESERVED	RD_DMA_STALL	PWRSCPCLK	MFLAGL						LL_FORCE_STATE						BURSTSIZE	TAGCNT				POSTED_WRITES			

Bits	Field Name	Description	Type	Reset
31:24	MFLAGH	Refer to section CAL Write DMA Real Time Traffic.	RW	0xFF
23	RESERVED		R	0
22	RD_DMA_STALL	Controls if the pixel stream from the RD DMA's FIFO to the internal pipeline shall be stalled when MFlag/=0. Shall be enabled to protect real time traffic against non real time, memory to memory dataflows through CAL. 0x0: Disabled. 0x1: Enabled. The MFlag information is propagated to the RD DMA FIFO readout control.	RW	0
21	PWRSCPCLK	Controls autogating of the PWRSCP clock 0x0: PWRSCP clock is automatically cut when it is not needed. 0x1: PWRSCP clock is free running	RW	0
20:13	MFLAGL	Refer to section CAL Write DMA Real Time Traffic	RW	0xFF
12:7	LL_FORCE_STATE	Forces the state of the CSI-3 low level protocol state machine. Intended to recover synchronization Writing 0 into this register has no effect. Reads always return 0s bit0: 0: the next OCPi transaction for this CPORT will only contain data 1: the next OCPi transaction for this CPORT will contain the CSI-3 packet header bit1~5: CPort ID (1..31)	W	0x00
6:5	BURSTSIZE	Maximum allowed burst size for the write DMA. 0x0: 16 bytes 0x1: 32 bytes 0x3: 128 bytes 0x2: 64 bytes	RW	0x3
4:1	TAGCNT	Maximum number of outstanding OCP transactions = TAGCNT+1	RW	0xF
0	POSTED_WRITES	0x0: Generate only non posted writes 0x1: Generate only posted writes	RW	0

Table 10-54. CAL_RD_DMA_CTRL

Address Offset	0x0000 0140	Instance	CAL
Physical Address	0x489B 0140		
Description	Read DMA control register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PCLK																OCP_TAG_CNT				BW_LIMITER				INIT	GO						

Bits	Field Name	Description	Type	Reset
31:15	PCLK	Controls the data rate at which data is read from the read DMA FIFO and sent to the internal processing pipeline. Data rate = FCLK * 8 * PCLK / 2 ¹⁶ Bytes/s HW guarantees that data is never sent at faster rate than defined by this register. The data may be sent at slower rate when the RD DMA FIFO is empty or the processing pipeline is busy (data from OCPI has higher priority) Missed slots are not cummulated. Valid range: 0 .. 2 ¹⁶	RW	0x0 0000
14:11	OCP_TAG_CNT	Maximum allowed number of outstanding OCP read requests minus 1 (i.e. 0xF meand up to 16 outstanding requests)	RW	0x0
10:2	BW_LIMITER	Defines a minimum cycle count between to consecutive read requests issued by the RD DMA. Used to limit the SDRAM load in memory to memory mode. The pixel rate should be controlled at video port level when data read from memory is send to the video port. Valid range = 9..4095 cycles	RW	0x000
1	INIT	Enable reading of DPCM decoder initialization data from SDRAM 0x0: Disabled 0x1: Enabled	RW	0
0	GO	Start data read from memory. This bit is set by SW and automatically cleared by HW when the frame has been processed. Write 0x0: No effect Write 0x1: Start read DMA Read 0x1: Read DMA BUSY / it is currently fetching data from memory and sends it to the processing pipeline Read 0x0: Read DMA idle / ready to receive the next start trigger from SW	RW	0

Address Offset	0x0000 0304 + (0x80 * I)	Index	I = 0 to 1
Physical Address	0x489B 0304 + (0x80 * I)	Instance	CAL
Description	COMPLEXIO CONFIGURATION REGISTER This register contains the lane configuration for the order and position of the lanes (clock and data) and the polarity order for the control of the PHY differential signals in addition to the control bit for the power FSM.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	RESET_CTRL	RESET_DONE	PWR_CMD	PWR_STATUS	PWR_AUTO	RESERVED						DATA4_POL	DATA4_POSITION	DATA3_POL	DATA3_POSITION	DATA2_POL	DATA2_POSITION	DATA1_POL	DATA1_POSITION	CLOCK_POL	CLOCK_POSITION										

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0
30	RESET_CTRL	Controls the reset of the complex IO 0x0: Complex IO reset active. 0x1: Complex IO reset de-asserted.	RW	0
29	RESET_DONE	Internal reset monitoring of the power domain using the PPI byte clock from the complex io Read 0x1: Reset completed. Read 0x0: Internal module reset is on going.	R	0
28:27	PWR_CMD	Command for power control of the complex io 0x0: Command to change to OFF state 0x1: Command to change to ON state 0x2: Command to change to Ultra Low Power state	RW	0x0
26:25	PWR_STATUS	Status of the power control of the complex io Read 0x2: Complex IO in Ultra Low Power state Read 0x1: Complex IO in ON state Read 0x0: Complex IO in OFF state	R	0x0
24	PWR_AUTO	Automatic switch between ULP and ON states based on ULPM signals from complex iO 0x0: Disable 0x1: Enable	RW	0
23:20	RESERVED		R	0x0
19	DATA4_POL	+/- differential pin order of DATA lane 4. 0x0: +/- pin order 0x1: -/+ pin order	RW	0

Bits	Field Name	Description	Type	Reset
18:16	DATA4_POSITION	Position and order of the DATA lane 4. The values 6 and 7 are reserved. 0x1: Data lane 4 is at the position 1. 0x0: Not used/connected 0x2: Data lane 4 is at the position 2. 0x4: Data lane 4 is at the position 4. 0x5: Data lane 4 is at the position 5. 0x3: Data lane 4 is at the position 3.	RW	0x0
15	DATA3_POL	+/- differential pin order of DATA lane 3. 0x0: +/- pin order 0x1: -/+ pin order	RW	0
14:12	DATA3_POSITION	Position and order of the DATA lane 3. The values 6 and 7 are reserved. 0x1: Data lane 3 is at the position 1. 0x0: Not used/connected 0x2: Data lane 3 is at the position 2. 0x4: Data lane 3 is at the position 4. 0x5: Data lane 3 is at the position 5. 0x3: Data lane 3 is at the position 3.	RW	0x0
11	DATA2_POL	+/- differential pin order of DATA lane 2. 0x0: +/- pin order 0x1: -/+ pin order	RW	0
10:8	DATA2_POSITION	Position and order of the DATA lane 2. The values 6 and 7 are reserved. 0x1: Data lane 2 is at the position 1. 0x0: Not used/connected 0x2: Data lane 2 is at the position 2. 0x4: Data lane 2 is at the position 4. 0x5: Data lane 2 is at the position 5. 0x3: Data lane 2 is at the position 3.	RW	0x0
7	DATA1_POL	+/- differential pin order of DATA lane 1. 0x0: +/- pin order 0x1: -/+ pin order	RW	0
6:4	DATA1_POSITION	Position and order of the DATA lane 1. 0, 6 and 7 are reserved. The data lane 1 is always present. 0x4: Data lane 1 is at the position 4. 0x1: Data lane 1 is at the position 1. 0x5: Data lane 1 is at the position 5. 0x3: Data lane 1 is at the position 3. 0x2: Data lane 1 is at the position 2.	RW	0x0
3	CLOCK_POL	+/- differential pin order of CLOCK lane. 0x0: +/- pin order 0x1: -/+ pin order	RW	0
2:0	CLOCK_POSITION	Position and order of the CLOCK lane. 0, 6 and 7 are reserved. The clock lane is always present. 0x4: Clock lane is at the position 4. 0x1: Clock lane is at the position 1. 0x5: Clock lane is at the position 5. 0x3: Clock lane is at the position 3. 0x2: Clock lane is at the position 2.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0
30	ECC_NO_CORRECTION	ECC has not been used to correct the header because there is more than 1-bit error (short and long packets). 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
29	RESERVED		R	0
28	SHORT_PACKET	Short packet (other than FS, FE, LS, LE) received. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
27	FIFO_OVR	CSI-2 low level protocol interface FIFO overflow 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
26	STATEALLULPMEXIT	At least one of the active lanes has exit the ULPM 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
25	STATEALLULPMENTER	All active lanes are entering in ULPM. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
24	STATEULPM5	Lane #5 in Ultra Low Power Mode 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
23	STATEULPM4	Lane #4 in Ultra Low Power Mode 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
22	STATEULPM3	Lane #3 in Ultra Low Power Mode 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
21	STATEULPM2	Lane #2 in Ultra Low Power Mode 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
20	STATEULPM1	Lane #1 in Ultra Low Power Mode 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
19	ERRCONTROL5	Control error for lane #5 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
18	ERRCONTROL4	Control error for lane #4 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
17	ERRCONTROL3	Control error for lane #3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
16	ERRCONTROL2	Control error for lane #2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
15	ERRCONTROL1	Control error for lane #1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
14	ERRESC5	Escape entry error for lane #5 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
13	ERRESC4	Escape entry error for lane #4 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
12	ERRESC3	Escape entry error for lane #3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
11	ERRESC2	Escape entry error for lane #2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
10	ERRESC1	Escape entry error for lane #1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
9	ERRSOTSYNCHS5	Start of transmission sync error for lane #5 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
8	ERRSOTSYNCHS4	Start of transmission sync error for lane #4 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
7	ERRSOTSYNCHS3	Start of transmission sync error for lane #3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
6	ERRSOTSYNCHS2	Start of transmission sync error for lane #2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
5	ERRSOTSYNCHS1	Start of transmission sync error for lane #1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
4	ERRSOTHS5	Start of transmission error for lane #5 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
3	ERRSOTHS4	Start of transmission error for lane #4 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
2	ERRSOTHS3	Start of transmission error for lane #3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
1	ERRSOTHS2	Start of transmission error for lane #2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
0	ERRSOTHS1	Start of transmission error for lane #1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Table 10-88. CAL_CSI2_TIMING_I

Address Offset	0x0000 0314 + (0x80 * I)	Index	I = 0 to 1
Physical Address	0x489B 0314 + (0x80 * I)	Instance	CAL
Description	TIMING REGISTER This register shall not be modified when CAL_CSI2_PPI_CTRL_I.IF_EN=1 It is used to indicate the number of functional clock cycles for the Stop State monitoring.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																FORCE_RX_MODE_IO1	STOP_STATE_X16_IO1	STOP_STATE_X4_IO1	STOP_STATE_COUNTER_IO1												

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15	FORCE_RX_MODE_IO1	Control of ForceRxMode signal 0x0: De-assertion of ForceRxMode. The HW reset the bit at the end of the Force RX Mode assertion. The SW can reset the bit in order to stop the assertion of the ForceRXMode signal prior to the completion of the period. 0x1: Assertion of ForceRxMode	RW	0
14	STOP_STATE_X16_IO1	Multiplication factor for the number of L3 cycles defined in STOP_STATE_COUNTER bit-field 0x0: The number of L3 cycles defined in STOP_STATE_COUNTER is multiplied by 1x 0x1: The number of L3 cycles defined in STOP_STATE_COUNTER is multiplied by 16x	RW	1

Bits	Field Name	Description	Type	Reset
13	STOP_STATE_X4_IO1	Multiplication factor for the number of L3 cycles defined in STOP_STATE_COUNTER bit-field 0x0: The number of L3 cycles defined in STOP_STATE_COUNTER is multiplied by 1x 0x1: The number of L3 cycles defined in STOP_STATE_COUNTER is multiplied by 4x	RW	1
12:0	STOP_STATE_COUNTER_IO1	Stop State counter for monitoring. It indicates the number of L3 to monitor for Stop State before de-asserting ForceRxMode (Complex IO #1). The value is from 0 to 8191.	RW	0x1FFF

10.5.3.2 CSI2 PHY Register Description

Table 10-127. REG0

Address Offset	0x0000 0000	Instance	CAMERARX_CORE_0 CAMERARX_CORE_1
Physical Address	0x489B 0800 0x489B 0900		
Description	First register. Note: For detailed description on parameter functionality, refer to MIPI D-PHY Specification v1.00.00.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RESERVED								HSCLOCKCONFIG	RESERVED								THS_TERM								THS_SETTLE							

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Reserved fields	NA	0x00
24	HSCLOCKCONFIG	Disable clock missing detector	RW	0
23:16	RESERVED	Read returns zero	R	0x00
15:8	THS_TERM	THS_TERM timing parameter in multiples of DDR clock frequency. Effective time for enabling of termination = synchronizer delay + timer delay + LPRX delay + combinational routing delay ~ (1-2)* DDRCLK + THS-TERM + ~ (1-15) ns. Programmed value = floor(20 ns/DDR_CLK), where DDR_CLK is the period of the CSI-2 I/O lane rate. Default value: 4 (for 400 MHz).	RW	0x04
7:0	THS_SETTLE	THS_SETTLE timing parameter in multiples of DDR clock frequency. Effective THS_SETTLE seen on line (starting to look for sync pattern) = synchronizer delay + timer delay + LPRX delay + combinational routing delay – pipeline delay in HS data path ~ (1-2)* DDRCLK + THS-SETTLE + ~ (1-15) ns – 1*DDRCLK. Programmed value = floor(105 ns/DDR_CLK) + 4, where DDR_CLK is the period of the CSI-2 I/O lane rate. Default value: 39 (for 400 MHz). Minimum supported THS-SETTLE programmed value = 3.	RW	0x27

Video Input Port

This chapter describes the Video Input Port (VIP) module for the device.

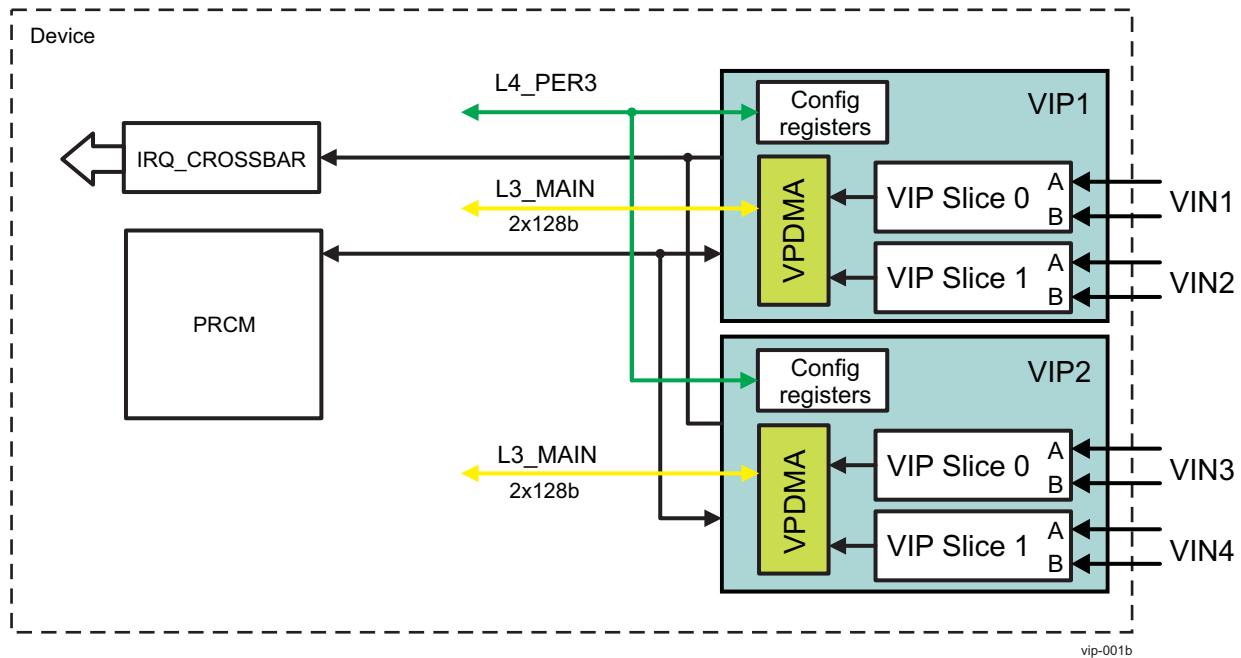

Topic	Page
11.1 VIP Overview	3399
11.2 VIP Environment	3401
11.3 VIP Integration	3407
11.4 VIP Functional Description	3409
11.5 VIP Register Manual	3553

11.1 VIP Overview

The VIP module provides video capture functions for the device. VIP incorporates a multi-channel raw video parser, various video processing blocks, and a flexible Video Port Direct Memory Access (VPDMA) engine to store incoming video in various formats. The device integrates two instantiations of the VIP module giving the ability of capturing up to eight video streams.

Figure 11-1 shows a block diagram with the VIP modules within the device.

Figure 11-1. VIP Overview

A VIP module includes the following main features:

- Two independently configurable external video input capture slices (Slice 0 and Slice 1) each providing up to two video input ports, Port A and Port B:
 - Port A can be configured as a 24/16/8-bit port.
 - Port B is a fixed 8-bit port.
 - At device level, the same device pads may be shared between Port A and Port B of each slice. For more information, see the multiplexing characteristics in device Data Manual.
- Each video Port A can be operated as a port with clock independent input channels (with interleaved or separated Y/C data input). Embedded sync and external sync modes are supported for all input configurations.
- Support for a single external asynchronous pixel clock, up to 165MHz per port.
- Pixel Clock Input Domain Port A supports up to one 24-bit input data bus, including BT.1120 style embedded sync for 16-bit and 24-bit data.
- Embedded Sync data interface mode supports single or multiplexed sources
- Discrete Sync data interface mode supports only single source input
- 24-bit data input plus discrete syncs can be configured to include:
 - 8-bit YUV422 (Y and U/V time interleaved)
 - 16-bit YUV422 (CbY and CrY time interleaved)
 - 24-bit YUV444
 - 16-bit RGB565
 - 24-bit RGB888
 - 12/16-bit RAW Capture

- 24-bit RAW capture
- Discrete sync modes include:
 - VSYNC + HSYNC (FID determined by FID signal pin or HSYNC/VSYNC skew)
 - VSYNC + ACTVID + FID
 - VBLANK + ACTVID (ACTVID toggles in VBLANK) + FID
 - VBLANK + ACTVID (no ACTVID toggles in VBLANK) + FID
- Multichannel parser (embedded syncs only):
 - Embedded syncs only
 - Pixel (2x or 4x) or Line multiplexed modes supported
 - Performs demultiplexing and basic error checking
 - Supports maximum of 9 channels in Line Mux (8 normal + 1 split line)
- Ancillary data capture support:
 - For 16-bit or 24-bit input, ancillary data may be extracted from any single channel
 - For 8-bit time interleaved input, ancillary data can be chosen from the Luma channel, the Chroma channel, or both channels
 - Horizontal blanking interval data capture only supported when using discrete syncs (VSYNC + HSYNC or VSYNC + HBLANK)
 - Ancillary data extraction supported on multichannel capture as well as single source streams
- Format conversion and scaling:
 - Programmable color space conversion
 - YUV422 to YUV444 conversion
 - YUV444 to YUV422 conversion
 - YUV422 to YUV420 conversion
 - YUV444 Source: YUV444 to YUV444, YUV444 to RGB888, YUV444 to YUV422, YUV444 to YUV420
 - RGB888 Source: RGB888 to RGB888, RGB888 to YUV444, RGB888 to YUV422, RGB888 to YUV420
 - YUV422 Source: YUV422 to YUV422, YUV422 to YUV420, YUV422 to YUV444, YUV422 to RGB888
 - Supports RAW to RAW (no processing)
 - Scaling and format conversions do not work for multiplexed input
- Supports up to 2047 pixels wide input - when scaling is engaged
- Supports up to 3840 pixels wide input - when only chroma up/down sampling is engaged, without scaling
- Supports up to 4095 pixels wide input - without scaling and chroma up/down sampling
- The maximum supported input resolution is further limited by:
 - Pixel clock and feature-dependent constraints
 - For RGB24-bit format (RAW data), the maximum frame width is limited to 2730 pixels
- Unsupported features of the VIP modules
 - The VIP modules do not have a power switch, making the power domain (PD_CAM) Always-On. For more information on the power domain, see [Section 3.7.14](#), PD_CAM (Physical PD_COREAON) Description.

A VPDMA module includes the following main features:

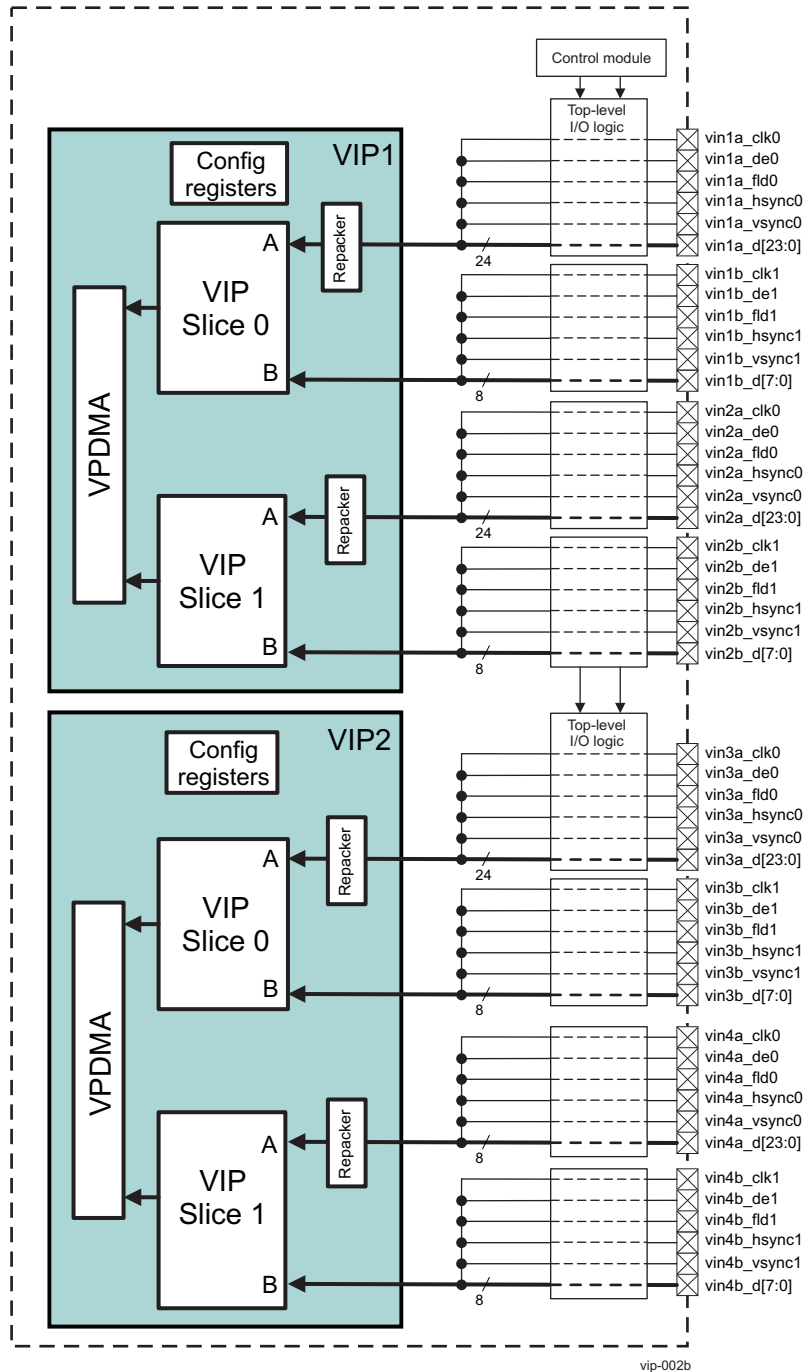

- VPDMA output buffer size restriction feature, which ensures that writes do not exceed allocated memory buffer size
- Support for Tiled (2D) and raster addressing without bandwidth penalty
- Dual clients per channel allows for capture of scaled and nonscaled versions of the data stream (non-multiplexed mode only)

- Start on new frame capability
- Interrupt every X number of frames
- Interrupt every X lines (sync'd to frame start)
- Dynamic MFLAG generation

11.2 VIP Environment

This section describes the VIP modules from an environment point of view (external connections). It describes the VIP connectivity options and lists all possible interfaces. [Figure 11-2](#) is a block diagram of the VIP environment.

Figure 11-2. VIP Environment

NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to different pads of the device and is programmable in the device Control Module registers and/or dedicated module registers. For more information, see [Section 20.4.6.1.1, Pad Configuration Registers](#) in [Chapter 20, Control Module](#).

Additionally, by configuring bits [12] VIP_SEL_4A, [11] VIP_SEL_3A, [10] VIP_SEL_2A and [9] VIP_SEL_1A of the CTRL_CORE_CONTROL_SPARE_RW register in the device Control Module it is possible to map the signals of CAL video ports (described in [Section 10.3.2, CAL Integration - Video Port](#)) to Port A of each VIP slice. [*New DRA7xxP feature versus DRA75x/DRA74x*]

Table 11-1. VIP1 Interface Signals

Sub-module Name	Signal Name	Type ⁽¹⁾	Description
Slice 0	vin1a_d[23:0]	I	Pixel data.
Port A	vin1a_clk0	I	Pixel clock.
	vin1a_vsync0	I	Vertical synchronization.
	vin1a_hsync0 ⁽²⁾	I	Horizontal synchronization.
	vin1a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin1a_fld0 ⁽²⁾	I	The FID signal indicates the field identifier for the video input field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.
Slice 0	vin1b_d[7:0]	I	Pixel data.
Port B	vin1b_clk1	I	Pixel clock.
	vin1b_vsync1	I	Vertical synchronization.
	vin1b_hsync1	I	Horizontal synchronization.
	vin1b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin1b_fld1	I	The FID signal indicates the field identifier for the video input field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.
Slice 1	vin2a_d[23:0]	I	Pixel data.
Port A	vin2a_clk0	I	Pixel clock.
	vin2a_vsync0	I	Vertical synchronization.
	vin2a_hsync0 ⁽²⁾	I	Horizontal synchronization.
	vin2a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin2a_fld0 ⁽²⁾	I	The FID signal indicates the field identifier for the video input field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.

⁽¹⁾ I = Input, O = Output, I/O = Input/Output

⁽²⁾ Signal not used (tied low) when VIP1 is connected to CAL video ports.

Table 11-1. VIP1 Interface Signals (continued)

Sub-module Name	Signal Name	Type ⁽¹⁾	Description
Slice 1	vin2b_d[7:0]	I	Pixel data.
Port B	vin2b_clk1	I	Pixel clock.

	vin2b_hsync1	I	Horizontal synchronization.
	vin2b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin2b_fld1	I	The FID signal indicates the field identifier for the LCD output field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.

Table 11-2. VIP2 Interface Signals

Sub-module Name	Signal Name	Type ⁽¹⁾	Description
Slice 0	vin3a_d[23:0]	I	Pixel data.
Port A	vin3a_clk0	I	Pixel clock.
	vin3a_vsync0	I	Vertical synchronization.
	vin3a_hsync0 ⁽²⁾	I	Horizontal synchronization.
	vin3a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin3a_fld0 ⁽²⁾	I	The FID signal indicates the field identifier for the LCD output field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.
Slice 0	vin3b_d[7:0]	I	Pixel data.
Port B	vin3b_clk1	I	Pixel clock.
	vin3b_vsync1	I	Vertical synchronization.
	vin3b_hsync1	I	Horizontal synchronization.
	vin3b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin3b_fld1	I	The FID signal indicates the field identifier for the LCD output field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.
Slice 1	vin4a_d[23:0]	I	Pixel data
Port A	vin4a_clk0	I	Pixel clock
	vin4a_vsync0	I	Vertical synchronization.
	vin4a_hsync0 ⁽²⁾	I	Horizontal synchronization.

⁽¹⁾ I = Input, O = Output, I/O = Input/Output

⁽²⁾ Signal not used (tied low) when VIP2 is connected to CAL video ports.

Table 11-2. VIP2 Interface Signals (continued)

Sub-module Name	Signal Name	Type ⁽¹⁾	Description
	vin4a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin4a_fld0 ⁽²⁾	I	The FID signal indicates the field identifier for the LCD output field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.
Slice 1	vin4b_d[7:0]	I	Pixel data.
Port B	vin4b_clk1	I	Pixel clock.
	vin4b_vsync1	I	Vertical synchronization.
	vin4b_hsync1	I	Horizontal synchronization.
	vin4b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin4b_fld1	I	The FID signal indicates the field identifier for the LCD output field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.

NOTE: At device level, the same device pads may be shared between Port A and Port B of each slice. For more information, see the multiplexing characteristics in device Data Manual.

Table 11-3 and Table 11-4 summarize the mapping of RGB and YUV color components to VIP input data signals, with corresponding settings of `VIP_MAIN[1:0] DATA_INTERFACE_MODE` register bit-field.

Table 11-3. VIP Port A Input Data Signals to RGB and YUV Color Components Mapping

VIP Port A Data Signals	24-bit RGB888 Input Mode	16-bit RGB565 Input Mode	24-bit YUV444 Input Mode	16-bit YUV422 Input Mode ⁽¹⁾	8-bit YUV422 Input Mode ⁽²⁾
X = 1 to 6	DATA_INTERFACE_MODE = 00b	DATA_INTERFACE_MODE = 00b	DATA_INTERFACE_MODE = 00b	DATA_INTERFACE_MODE = 01b	DATA_INTERFACE_MODE = 10b

⁽¹⁾ Chroma is time division multiplexed (interleaved). For more details, see Section 11.4.5.6.2, *16b Interface Mode*.

⁽²⁾ Luma and Chroma are time division multiplexed (interleaved). For more details, see Section 11.4.5.6.1, *8b Interface Mode*.

NOTE: 16-bit RGB data can be captured also on the `vinXa_d[15:0]` input data bus of Port A. In this case, the 16-bit RGB data captured by the `VIP_PARSER` will be passed to `VPDMA`, as if it is a 16-bit YUV data. The `VIP_MAIN[1:0] DATA_INTERFACE_MODE` register bit-field must be configured for a 16-bit input mode. The `VPDMA` will then directly store this data in memory as a 16-bit data, provided that any 16-bit data type in the `VPDMA` outbound descriptor is set.

Table 11-4. VIP Port B Input Data Signals to YUV Color Components Mapping

VIP Port B Data Signals	8-bit YUV422 Input Mode ⁽¹⁾
Y = 1 to 4	DATA_INTERFACE_MODE = 10b

11.3 VIP Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests. [Figure 11-3](#) summarizes the integration of the module in the device.

Figure 11-3. VIP Integration

[Table 11-5](#) and [Table 11-6](#) list the integration attributes and clock and resets, respectively.

Table 11-5. VIP Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
VIP1 VIP2	PD_CAM	L4_PER3 for configuration L3_MAIN for data (through VPDMA module)

Table 11-6. VIP Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VIP1	L3_CLK PROC_CLK	VIP1_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VIP subsystem uses this clock to fetch external data and transfer this data to internal processing. PROC_CLK is the clock used to drive data processing within the VIP subsystem.
	L4_CLK	VIP1_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus
VIP2	L3_CLK PROC_CLK	VIP2_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VIP subsystem uses this clock to fetch external data and transfer this data to internal processing. PROC_CLK is the clock used to drive data processing within the VIP subsystem.
	L4_CLK	VIP2_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VIP1	VIP_RST	CAM_RST	PRCM	VIP1 Reset
VIP2	VIP_RST	CAM_RST	PRCM	VIP2 Reset

Table 11-7. VIP Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
VIP1	VIP1_IRQ1	IRQ_CROSSBAR_351	N/A	VIP1 interrupt requests. These IRQ source signals are not mapped by default to any device INTC.
	VIP1_IRQ2	IRQ_CROSSBAR_392	N/A	
VIP2	VIP2_IRQ1	IRQ_CROSSBAR_352	N/A	VIP2 interrupt requests. These IRQ source signals are not mapped by default to any device INTC.
	VIP2_IRQ2	IRQ_CROSSBAR_393	N/A	

NOTE: The “Default Mapping” column in [Table 11-7 VIP Hardware Requests](#) shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.

For more information about the IRQ_CROSSBAR module, see [Section 20.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 20, Control Module](#).

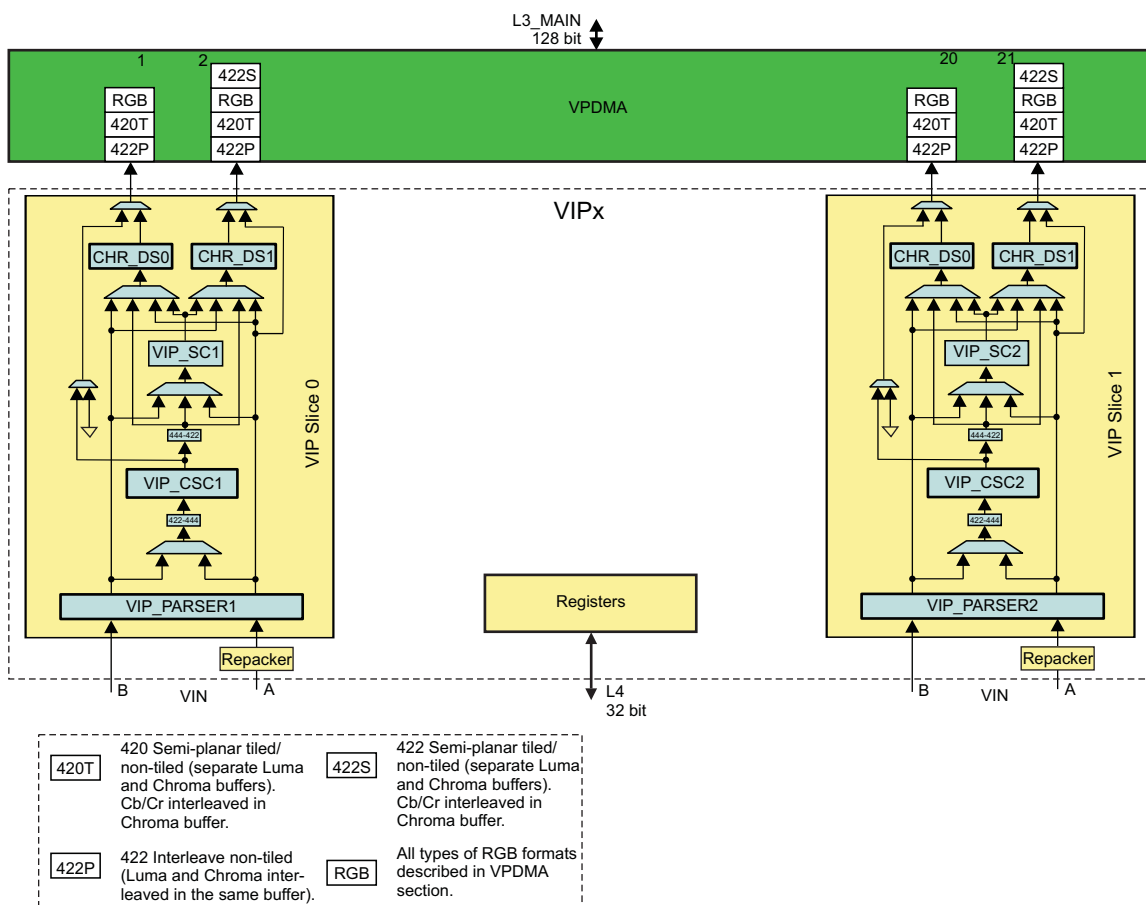

For more information about the device interrupt controllers, see [Chapter 19, Interrupt Controllers](#).

11.4 VIP Functional Description

11.4.1 VIP Block Diagram

Figure 11-4 shows the internal structure of a single VIP module in the device.

Figure 11-4. VIP Block Diagram

vip-004

11.4.2 VIP Software Reset

Software reset in the VIP module can be done by setting the [VIP_CLKC_RST\[16\]](#) VIP1_DP_RST for Slice 0, [VIP_CLKC_RST\[17\]](#) VIP2_DP_RST for Slice 1, [VIP_CLKC_RST\[0\]](#) VPDMA_RST for VIP VPDMA to 0x1. By setting [VIP_CLKC_RST\[31\]](#) MAIN_RST reset is performed for all modules within the instance. Software must ensure that the software reset completes before performing operations within the VIP module.

11.4.3 VIP Power and Clocks Management

The VIP modules support the MStandby/Wait and IdleReq/SidleAck protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

Power Management within the VIP module can be accomplished in several ways:

- L4 MConnect/SConnect can disable the internal L4 clock network
- L3 MConnect/Sconnect can disable the internal L3 clock network

These items are accomplished using the standard slave idle (for L4) and master standby (for L3) protocols. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shut down applies to the clock signals - L3_CLK and L4_CLK.

11.4.3.1 VIP Clocks

The VIP internal clock domains can only be shut down by writing the appropriate register bit within the Clock Enable register - [VIP_CLKC_CLKEN\[16\]](#) VIP1_DP_EN for slice0, [VIP_CLKC_CLKEN\[17\]](#) VIP2_DP_EN for slice1 and [VIP_CLKC_CLKEN\[0\]](#) VPDMA_EN for the VPDMA engine

11.4.3.2 VIP Idle Mode

The VIP supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the [VIP_SYSCONFIG\[3:2\]](#) IDLEMODE bit field.

Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.

- Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements.
- No-idle mode: local target never enters idle state.
- Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA related requests) wakeup events

11.4.3.3 VIP StandBy Mode

The VIP supports no-standby mode and force-standby mode. The mode is set in the [VIP_SYSCONFIG\[5:4\]](#) STANDBYMODE bit field.

Configuration of the local initiator state management mode:

- Force-standby mode: local initiator is unconditionally placed in standby state.
- No-standby mode: local initiator is unconditionally placed out of standby state.

11.4.4 VIP Slice

11.4.4.1 VIP Slice Processing Path Overview

[Figure 11-5](#) shows in details the internal processing path and output signals to VPDMA for a single VIP Slice. External video source drives the input side of the VIP Slice. Port A[x:y] can be in YUV422 format (A[15:0] in the diagram) or RGB/YUV444 format (A[23:0] in the diagram), depending on the external video input source and configuration options within the VIP_PARSER. Port B[x:y] can be in YUV422 format (B[15:0] in the diagram). When the VIP_PARSER is configured to capture 24bit RGB/444 data, A[23:0] is used and the data path inside VIP must be configured correctly for it. Multiplexer selections and controls shown in [Figure 11-5](#) are described in register [VIP_CLKC_VIP0DPS](#) for Slice 0, and register [VIP_CLKC_VIP1DPS](#) for Slice 1. The outputs of each VIP Slice drive the VPDMA module, which sends the resulting data to DDR memory.

Figure 11-5. VIP Slice Processing Path Block Diagram

Table 11-8 provides summary of the registers controlling the multiplexers within VIP slice processing path.

Table 11-8. VIP Slice Processing Path Control

Multiplexer Control	Register Bit-fields for Slice 0	Register Bit-fields for Slice 1	Description

11.4.4.2 VIP Slice Processing Path Multiplexers

11.4.4.2.1 VIP_CSC Multiplexers

The following registers are controlling the VIP Color Space Converter (CSC) multiplexers: [VIP_CLKC_VIP0DPS\[2:0\]](#) VIP1_CSC_SRC_SELECT for Slice 0 and [VIP_CLKC_VIP1DPS\[2:0\]](#) VIP2_CSC_SRC_SELECT for Slice 1.

The VIP_CSC block (for each slice within the VIP subsystem) receives data from one of the following sources:

- VIP_PARSER Port A Output (422)
- VIP_PARSER Port B Output (422)
- VIP_PARSER Port A Output (RGB)

The default state for this multiplexer is disabled, so there is no VIP_CSC input.

11.4.4.2.2 VIP_SC Multiplexer

The multiplexer for Slice 0 and Slice 1 is controlled by [VIP_CLKC_VIP0DPS\[5:3\]](#) VIP1_SC_SRC_SELECT and [VIP_CLKC_VIP1DPS\[5:3\]](#) VIP2_SC_SRC_SELECT, respectively.

The scaler module (VIP_SC) within the VIP subsystem (for a single slice) receives data from one of the following sources:

- VIP_CSC
- VIP_PARSER Port A Output
- VIP_PARSER Port B Output

The default state for this multiplexer is disabled, so there is no VIP_SC input.

11.4.4.2.3 Output to VPDMA Multiplexers

This section is under development and is included as a placeholder for future updates.

11.4.4.3 VIP Slice Processing Path Examples

The following sections provide VIP Slice data path examples for different types of input data, and describe the corresponding multiplexer configurations. Refer to [Table 11-8](#), *VIP Slice Processing Path Control*, for mapping of the multiplexer controls to registers.

In the block diagrams of the following sections:

- Output A refers to the result of processing Input A data.
- Output B refers to the result of processing Input B data.

11.4.4.3.1 Input: A=RGB, B=YUV422; Output: A=RGB, B=RGB

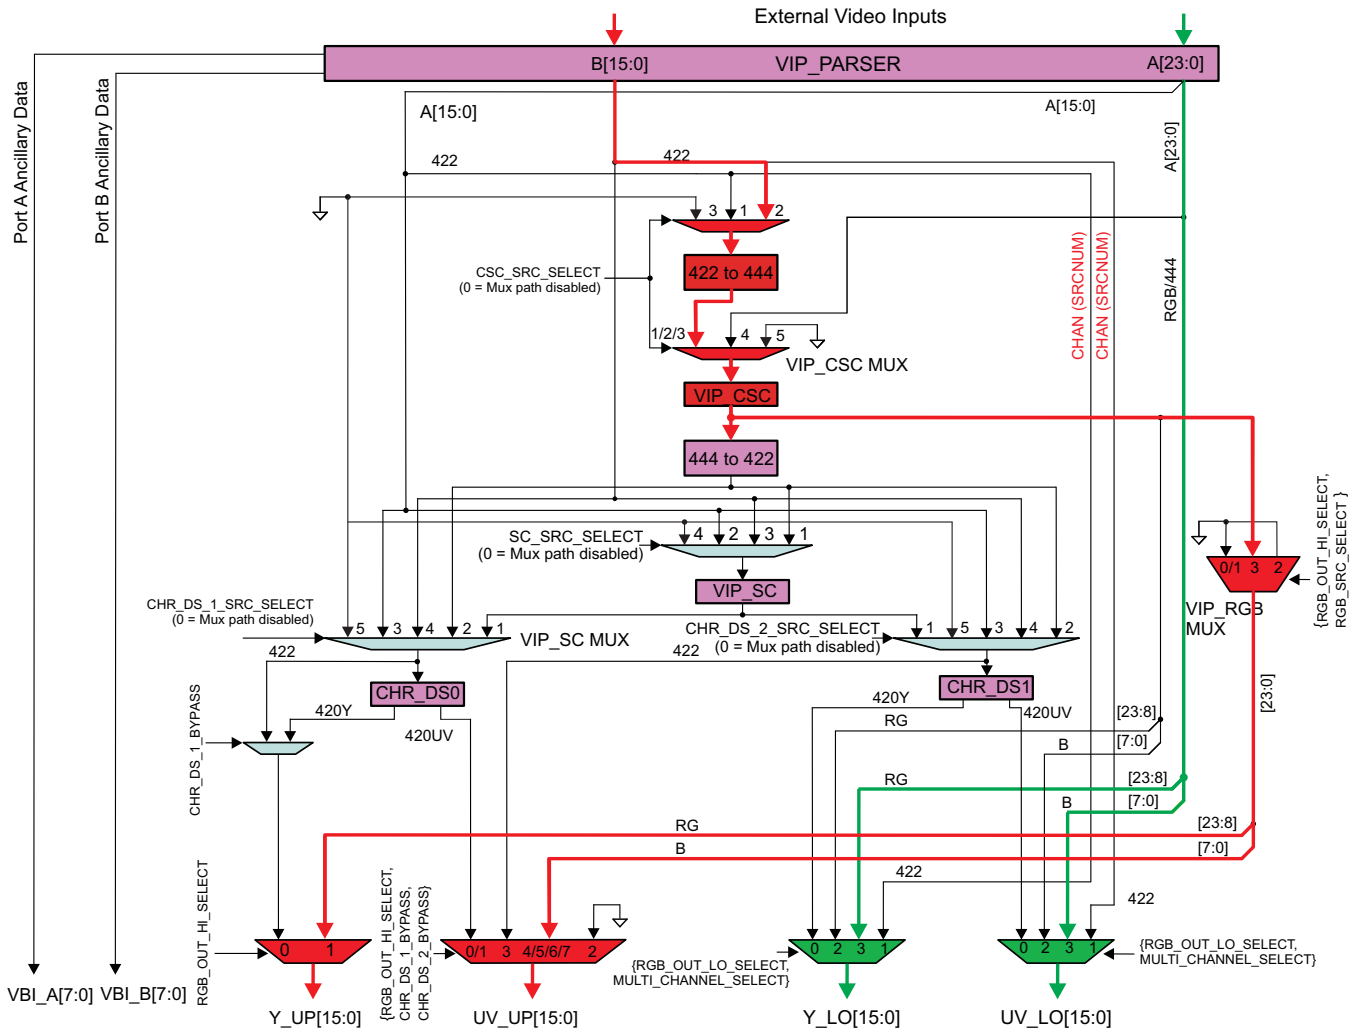

Tested in single channel embedded and discrete mode.

Input: A=RGB, B=YUV422; Output: A=RGB, B=RGB

11.4.5 VIP Parser

The VIP Parser (VIP_PARSER) module is used to capture the external video data into the VIP module.

11.4.5.1 Features

Each VIP module contains two VIP_PARSER modules (one VIP_PARSER per slice).

For a single VIP_PARSER, the video capture functions include:

- Two Pixel Clock Input Domains are supported (Port A and Port B):
 - Each Pixel Clock Input Domain has separate clock and framing signals.
 - Each Pixel Clock Input Domain can support embedded (BT.656/1120 style in /24-bit, or BT.656 in 8-bit) or discrete (BT.601 style) sync.
 - Pixel Clock Input Domain Port B supports one 8-bit input data bus. Port A supports one 24-bit input data bus. At device level, the same device pads may be shared between Port A and Port B. For more information, see the multiplexing characteristics in device Data Manual.
- Embedded Sync data interface mode supports single or multiplexed sources;
- Discrete Sync data interface mode supports only single source input;
- The two Pixel Clock Input Domains can be individually configured in any combination of Embedded or Discrete Sync;
- Vertical Ancillary Data capture is supported for each input source;
- A maximum of 8 + 1 (8 normal line sources + 1 split-line source) multiplexed sources are supported for a single Pixel Clock Input Domain using TI Line Mux Mode;
- Multiplexed data can only appear in embedded sync mode;
- Where possible, blanking pixels that may contain embedded vertical ancillary data will be stored in a dedicated buffer per each video source;
- Optional selection of channel (Luma or Chroma, or both) from which Vertical Ancillary data is extracted for YUV422 source;
- For RGB source, Vertical Ancillary data can be found in one of the R, G, or B channels. The VIP_PARSER can select the channel from which Vertical Ancillary data is extracted;
- Ancillary Data can appear in the Horizontal Blanking as well as the Vertical Blanking. Typically, only Vertical Blanking Ancillary Data is captured. However, Horizontal Blanking Ancillary Data can be captured as well using HSYNC style discrete sync capture mode;
- Video up to WUXGA (1920 × 1200) can be supported using Port A in 16-bit or 24-bit mode.

11.4.5.2 Repacker

The Repacker module rearranges the input bit ordering of the 24-bit data bus on Port A of each VIP slice. This module allows external input data to be presented to the datapath such that various data packing formats can be achieved in memory. As shown in [Figure 11-15](#), a Repacker exists for each 24-bit input port.

The Repacker module is a simple multiplexer that serves to move input bits to different locations on the its output bus to VIP Parser. [Figure 11-15](#) shows the supported bytelane swapping modes corresponding to different `VIP_XTRA_PORT_A[30:28]` `REPACK_SEL` settings.

Figure 11-15. Bytelane Swapping Modes

16-bit RAW data entering the VIP subsystem is packed as a contiguous input bus from bits 15 to 0. This 16-bit RAW input must be remapped to the RGB565 format, so that it can be saved to DDR memory properly, because the VPDMA does not support the RAW16 input format natively. Instead, the RAW 16 format is first remapped as RGB565 data and then given to the VPDMA. [Figure 11-16](#) describes the `VIP_XTRA_PORT_A[30:28]` `REPACK_SEL = 6` option to remap a contiguous [15:0] RAW input data bus to a RGB565 compliant output bus. This RAW16 data will use RGB565 data types in the VPDMA Data Descriptors.

Figure 11-16. RAW16 to RGB565 Mapping

[Figure 11-17](#) describes the mux configuration where 12 bit components are swapped. This mode may be useful when the input data is 12 bit per component YUV422 and is sent directly to memory.

Figure 11-17. RAW12 Swap

NOTE: There is no repacker for the 8-bit input port (Port B of each VIP slice).
The RAW16 and RAW12 mapping modes do not work for embedded sync streams.

11.4.5.3 Analog Video

A digital interface stream is based on analog video. The waveform for a line of NTSC analog video is shown in [Figure 11-18](#).

Figure 11-18. NTSC Analog Video Waveform for One Horizontal Line

T is a time constant. For NTSC, $T=1/13.5 \text{ MHz} = 74\text{ns}$.

11.4.5.4 Digitized Video

Digitized video is based on scan lines in found in analog video. BT.601 uses various sync signals to specify when a new field and a new line starts. BT.656 and BT.1120 uses sync words embedded in the data stream to specify start of field and start of line.

An image can be digitized into regions shown in [Figure 11-19](#).

Figure 11-19. Digitized Video

With the capability to encode sync words inside the data stream, there is more flexibility for adding non-video related data, called Ancillary Data. Also, code words embedded in the digital stream can be used as a type of identifier for multiplexing several sources of video into one data stream.

Figure 11-20 shows End-of-Active-Video (EAV) and Start-of-Active-Video (SAV) code words added to a video transmission. The period between the EAV and SAV is equivalent to Horizontal Blanking. The period between the SAV to the next EAV is active video or vertical blanking.

In the BT.656 or BT.1120 embedded code word scheme, three bits of the EAV/SAV code word are important: F (field), H (horizontal blanking), and V (vertical blanking).

Figure 11-20. Code Word Embedded Video Format

Figure 11-21 shows the values of F, V, and H flags at different locations in the picture. The Field flag represents the state of the Field ID for the picture. For progressive frames, F is always '0.' The V flag specifies vertical blanking areas. The H flag specifies horizontal blanking portions of the picture.

Figure 11-21. Digitized Video with F, V, and H Flags in EAV/SAV

11.4.5.5 Frame Buffers

The VIP/VPDMA support Frame Buffers in DDR memory for Active Video and Ancillary Data.

4:2:2 data is always saved in packed pixel buffers.

4:2:0 data is saved in Planar Luma buffers and Planar CbCr pair buffers.

A Luma Frame Buffer is a Planar storage area. Each line is the width in pixels (1Byte/pixel) of the output picture size format. The frame buffer contains the number of active video lines in the output picture size format.

A Chroma Pair Frame Buffer is Planar storage of CbCr pixel pairs, with each pixel being a byte. For 4:2:0 storage, N lines in the output picture active video results in N/2 lines of CbCr pairs being stored.

The Ancillary Data buffer is different than the Active Video Frame Buffers. The Ancillary Data buffer only stores Vertical Blanking Ancillary Data. The number of lines in the Ancillary Data buffer is the same as the number of Vertical Blanking lines. Typically, only one channel is extracted from the Vertical Blanking data, so the width of the Ancillary Data buffer is the same as the width of the Luma Buffer.

In 8-bit input mode, it is possible for both Luma and Chroma sites to be extracted for Vertical Ancillary data. Each color component is strobed on separate input clock cycles. In this case, the line width of the Ancillary data is twice the Luma line width of the picture. Both Luma and Chroma sites cannot be extracted for 16-bit input mode because both Luma and Chroma are sent on the same input clock cycle and the Ancillary port to the VPDMA VPI is only 8 bits wide.

Figure 11-22 shows how the planar data regions are stored in DDR memory. The vertical blanking data is stored in a set of Planar Buffers. Note that the bottom of the Vertical Ancillary Data from the previous field or frame is stored in the same buffer as the top of the Vertical Ancillary Data from the current field or frame.

Figure 11-22. Planar Buffer Storage Description

The Luma representing Active Video is stored in a set of Planar Buffers. The CbCr Chroma Pairs are stored in a set of Planar Buffers.

11.4.5.6 Input Data Interface

This section describes how the data (luma and chroma data for YUV422 format capture and R,G, and B data for RGB888 format capture) is muxed for the various interface modes.

11.4.5.6.1 8b Interface Mode

In 8-bit data interface mode, the input pixels are multiplexed according to [Figure 11-23](#). The Chroma Format is 4:2:2. Sites with Cb/Cr pixels are known as Chroma sites. Those sites with Y pixels are known as Luma sites.

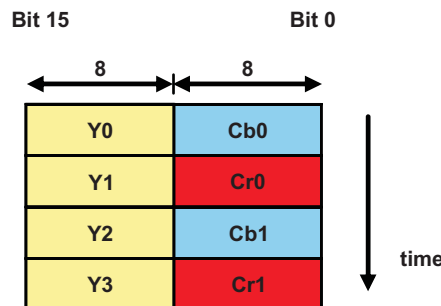

Figure 11-23. 8-bit Interface Discrete Sync Pixel Multiplexing

11.4.5.6.2 16b Interface Mode

In 16-bit interface mode, Luma is on 8 MSB bits of the data bus and Cb/Cr chroma pixels alternate on the other 8 bits of the data bus as shown in [Figure 11-24](#).

Figure 11-24. 16-bit Interface Discrete Sync Pixel Multiplexing

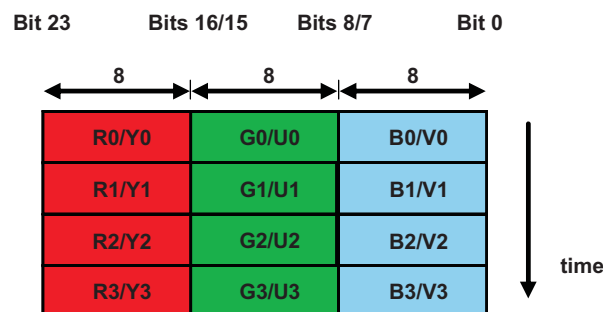

11.4.5.6.3 24b Interface Mode

RGB or YUV444 data is sent in 24b Interface Mode. The three components are packed into the data bus and sent to the VPDMA. The 24-bit Luma VPI client to the VPDMA carries all three components. This data is saved to the DDR in packed mode. That is, the three components are not separated by hardware. The 24-bit data bus is shown in [Figure 11-25](#).

Ancillary data is saved in the Ancillary Data buffer. The [VIP_PORT_A\[5:4\] CTRL_CHAN_SEL](#) and [VIP_PORT_B\[5:4\] CTRL_CHAN_SEL](#) configuration register is used to select whether the ancillary data is from the R/Y, G/U, or B/V channels.

Figure 11-25. 24b Interface RGB Discrete Sync

In 24b interface mode YUV4:4:4 data is also supported. The flow for YUV4:4:4 data is the same as RGB data (Figure 11-25). Bits [23:16] of the input data bus are placed on bits [23:16] of the data bus going to VPDMA, bits [15:8] of the input bus are placed on bits [15:8] of the data bus going to VPDMA and finally bits [7:0] of the input data bus, are placed on bits [7:0] on the bus going to VPDMA.

11.4.5.6.4 Signal Relationships

A digital representation of video can be realized by using HSYNC and VSYNC signals to identify frame start and line start. Suppose HSYNC and VSYNC are active high, Figure 11-26 shows the general relationship of these signals.

Every PIXCLK cycle carries either an active pixel or a blanking pixel. VSYNC pulses between two fields (or frames, in the case of progressive video). HSYNC pulses to signify the beginning of every line. An ACTVID signal can be used as a data valid to specify active video.

Discrete Sync cannot be used with any multi-camera multiplexed stream inputs. In the device, if Port A is configured for 24-bit discrete sync, then Port B must be disabled since there are no more data input pins left over for Port B.

If Port A is not 24 bits, then the 8-bit Port B can be configured and enabled for either discrete or embedded sync.

11.4.5.6.5 General 5 Pin Interfaces

Discrete Sync signal handling varies among different sending devices. The information that must be conveyed includes the pixel data value, field ID, horizontal blanking, and vertical blanking. Many devices can be configured to adjust the timing of the signals relative to each other.

In this section, DATA will be depicted as 8 bits. However, discrete sync does optionally support 16-bit and 24-bit data input. Type 1 is named after a generic five pin interface between the sending and receiving devices.

In Figure 11-27, P0 represents the first pixel in the horizontal blanking interval following the last vertical blanking line of the previous field or frame. HSYNC specifies the horizontal blanking region and VSYNC specifies that the P0 pixel is in the vertical sync area. HSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of horizontal blanking or HSYNC may be active for the full duration of horizontal blanking.

Likewise, VSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of vertical blanking or VSYNC may be active for the full duration of vertical blanking.

FID can change at this pixel or it may change later. For interlaced source, though, the FID will be inverted for this pixel at the same time point in the next field. So, it does not really matter when FID is captured. Many sending devices allow the location of FID changes to be programmable.

In this diagram and all others in this document, the active polarities of the interface signals can be either high or low. For the sake of uniformity in this document, all polarities are drawn active high. Also, different vendors have different datasheet names for the interface signals.

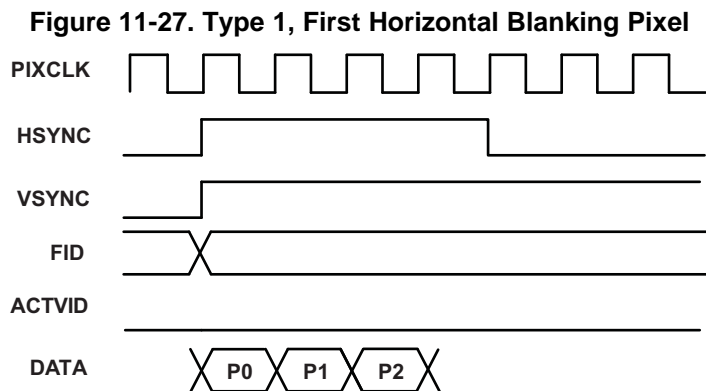

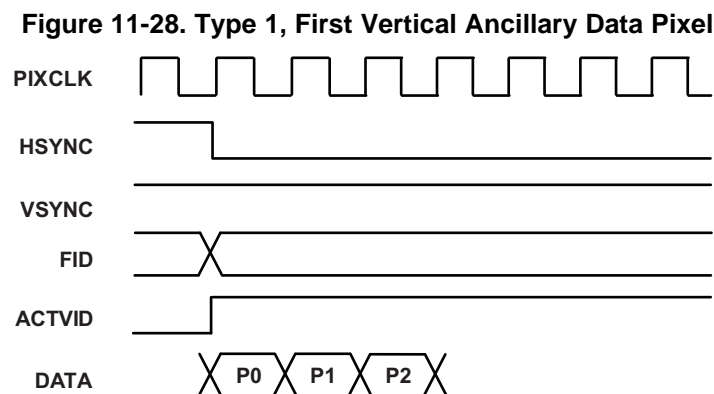

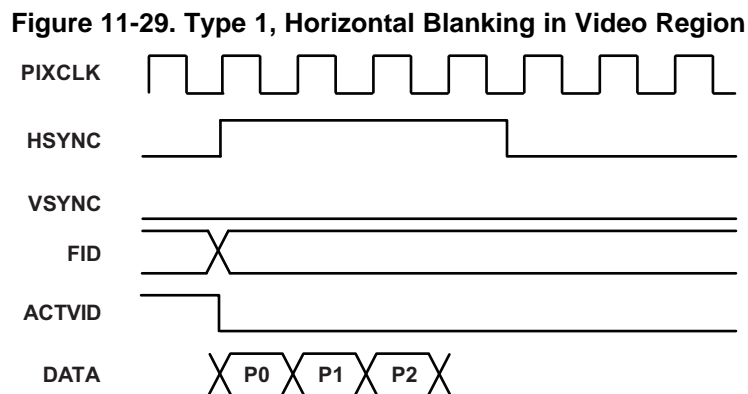

Figure 11-28 shows the P0 pixel being the first Chroma Channel data value in the Vertical Ancillary Data region. HSYNC is definitely de-asserted by now since P0 is no longer in horizontal blanking. ACTVID may or may not be active for Vertical Ancillary Data. Some devices consider these pixels to be Active (as in non-horizontal blanking). Other devices consider only video to be ACTIVE Video.

Following the vertical blanking region, the video portion of the field or frame starts. Figure 11-29 shows the horizontal blanking area in this video portion of the field or frame. P0 is the first pixel in the horizontal blanking. HSYNC is active for one or more pixel clocks. VSYNC is inactive in this video area. FID can change here. ACTVID is low since P0 is horizontal blanking.

In Figure 11-30, P0 represents the first Chroma pixel in the Active video line. HSYNC is inactive, since P0 is in the active video region. Likewise, VSYNC is inactive. FID may or may not change here. ACTVID is high to signal capturing of video pixels.

Figure 11-30. Type 1, First Video Pixel

11.4.5.6.6 Signal Subsets—4 Pin VSYNC, ACTVID, and FID

A sending device may use only a subset of the signals described in Section 11.4.5.6.4. The sending device just needs to convey important signals required to capture the field or frame. It can be shown that various selections of four pins can be used to satisfy all Type 1 conditions.

Three pins, VSYNC, ACTVID, and FID, plus a pixel clock can be used to support discrete sync. VSYNC would bump the capture buffer. An inactive to active level of ACTVID specifies a line of data to capture. FID determines the field ID polarity. The scenario in which the sending device wants the receiving end to capture Vertical Ancillary Data using 4-pin signaling is shown in Figure 11-31.

Figure 11-31. 4-Pin Reduced ACTVID Signaling with Vertical Ancillary Data

Figure 11-32 describes the case using the 4-pin interface in which the sending device does not send Vertical Ancillary Data.

Figure 11-32. 4-Pin Reduced ACTVID Signaling with No Vertical Ancillary Data

11.4.5.6.7 Signal Subsets—4 Pin VSYNC, HSYNC, and FID

In this style of Discrete Sync, as shown in Figure 11-33, four pins are used including the Pixel Clock. HSYNC signals the beginning of the line. All data in the line is captured, including Horizontal Blanking Data. In fact, this signaling mode is the only one which allows Horizontal Blanking Data to be captured.

Of course, by capturing the horizontal blanking pixels in the frame buffers, there is no way to be certain exactly where the blanking ends and the active video starts. One would have to rely solely on video format specs to find the active video inside the frame buffer.

Figure 11-33. 4-Pin Reduced HSYNC Signaling with Vertical Ancillary Data

11.4.5.6.8 Vertical Sync

Vertical Sync is used to indicate lines that are in the vertical blanking interval. The VSYNC also separates fields or frames. To be spec compliant, VSYNC should be active for a few lines at the bottom of the picture. The exact number of vertical blanking lines at the bottom depends on the specification for the picture format (480i, 480p, 720p, 1080i, 1080p).

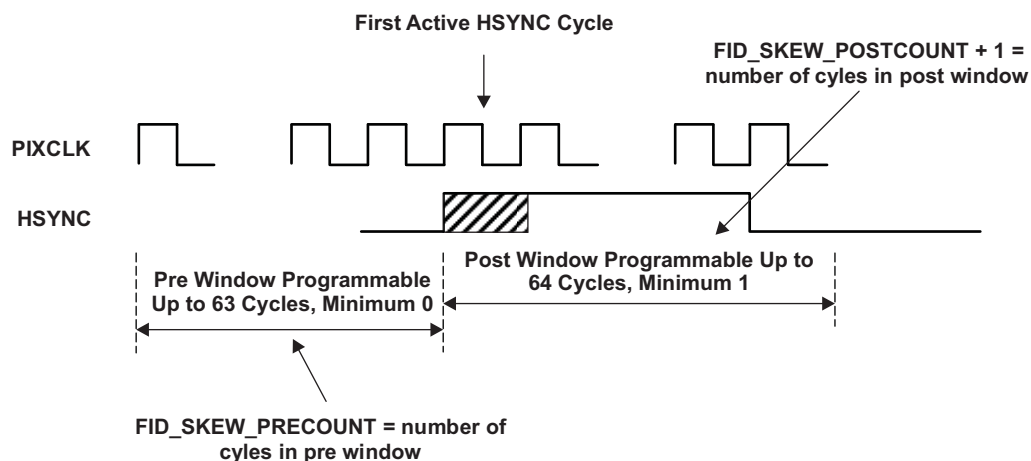

Likewise, the number of vertical blanking lines at the top of the picture depends on the video format specification corresponding to the incoming picture.

In the VIP_PARSER, lines associated with an Active VSYNC are stored in the vertical ancillary data buffers using the ANC VPI port to the VPDMA. Lines without an Active VSYNC are stored in the active video Luma and Chroma-pair buffers using the Y and UV VPI ports, respectively, to the VPDMA.

When using HSYNC signaling instead of ACTVID, the VSYNC signal may be derived from an analog source such as an NTSC/PAL decoder. In this case, VSYNC may not transition on the exact cycle as HSYNC. Thus, the VIP_PARSER supports a window region around HSYNC in which VSYNC transitions will be detected. A VSYNC transition occurring within the window is identified the same way as if VSYNC transitioned on the same cycle as HSYNC going active.

The window is defined by a pre-window, which is determined by the [VIP_PORT_A\[21:16\]](#) FID_SKEW_PRECOUNT and [VIP_PORT_B\[21:16\]](#) FID_SKEW_PRECOUNT registers. There is also a post-window that is defined by [VIP_PORT_A\[29:24\]](#) FID_SKEW_POSTCOUNT and [VIP_PORT_B\[29:24\]](#) FID_SKEW_POSTCOUNT for port B. Note that although the configuration registers are named FID_SKEW, they are also used for defining the VSYNC transition window. The window region definition is shown in [Figure 11-34](#).

Figure 11-34. VSYNC Pre and Post Window

The results of VSYNC behavior in the transition window are shown in [Figure 11-35](#). A low to high transition in the window is equivalent to VSYNC going low to high on the active HSYNC cycle.

Likewise, a high to low transition in the window is equivalent to VSYNC going high to low on the active HSYNC cycle.

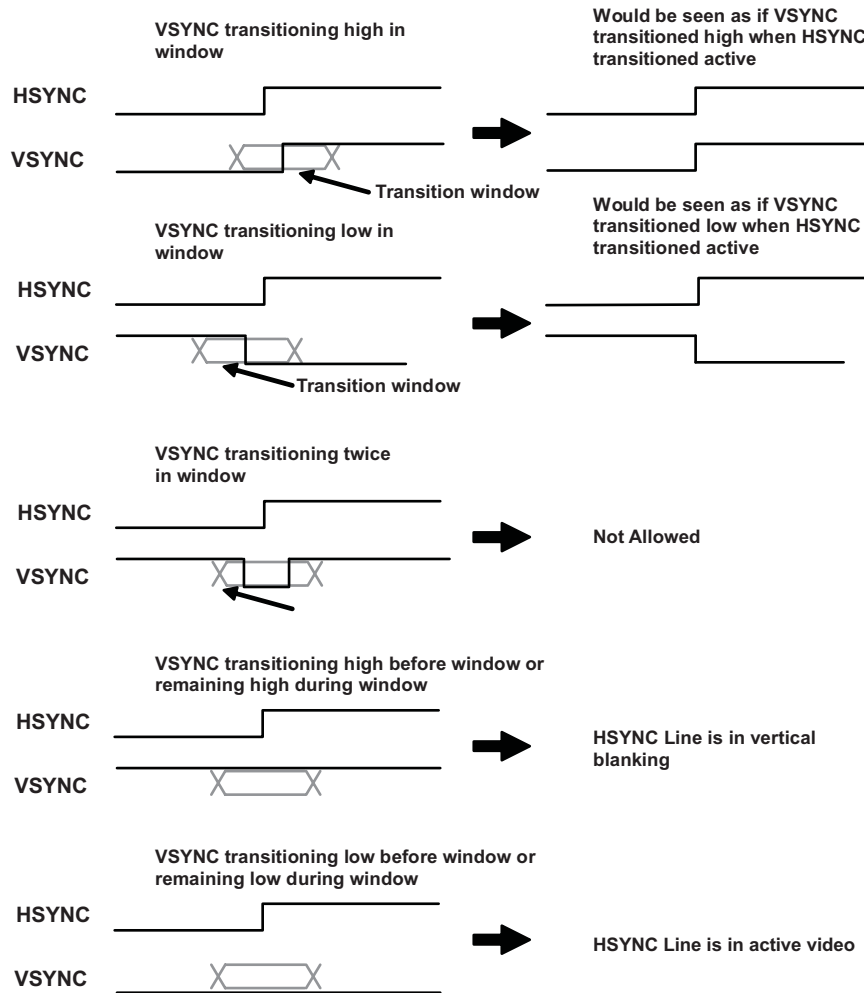

Two transitions of VSYNC within the VSYNC window is not allow and is undefined behavior.

If VSYNC is high throughout the transition window, then the HSYNC line is in vertical blanking.

If VSYNC is low throughout the transition window, then the HSYNC line is in active video.

Note that VSYNC skew generally only applies to input signals that have been sampled from an analog source, as in a NTSC/PAL decoder. If the VSYNC is a VBLANK-type signal or if the sending device is another all-digital IC, then the VSYNC signal does not have a skew since VSYNC will be aligned to HSYNC. In this case, setting FID_SKEW_PRECOUNT = '0' and FID_SKEW_POSTCOUNT = '0' (within PORT_A and PORT_B registers) defines a minimum size window which will capture the value of VSYNC on the same cycle that HSYNC goes active.

Figure 11-35. VSYNC Equivalence When Using Transition Window

11.4.5.6.9 Field ID Determination Using Dedicated Signal

For Progressive Source, FIELD ID is always '0.'

For Interlaced Source, FIELD ID needs to be extracted consistently.

In some cases, vertical sync is active on the first pixel of a line in the vertical blanking period and it stays active until the last line in the vertical blanking period.

However, the pixel where the FIELD ID signal transitions can be quite variable and depends on the external chip driving the VIP_PARSER. Many parts that generate digitized raw video have a programmable feature to specify when FIELD ID changes. FIELD ID is valid at the same point for every field. That is, if FIELD ID is read at one particular place in a field, the polarity of the signal will be reversed at the same location in the next field. So, FIELD ID can be corrected with a programmable polarity configuration bit FID_POLARITY (within `VIP_PORT_A` and `VIP_PORT_B` registers) that is XOR'ed with the captured value.

For discrete sync mode, FIELD ID will be registered on the first active pixel capture cycle of each line in both styles of HSYNC and ACTVID usage as specified in [Figure 11-36](#) and [Figure 11-37](#).

Figure 11-36. FID Registering When Using HSYNC

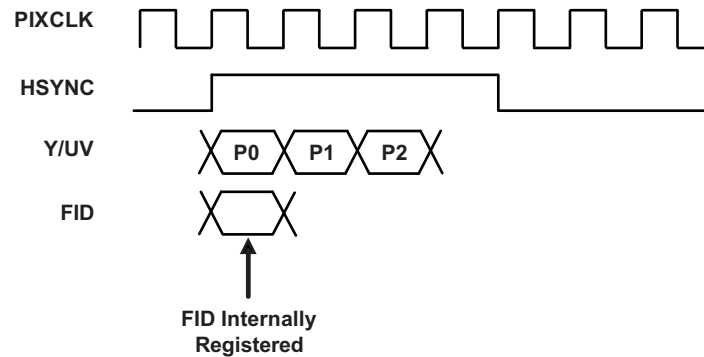

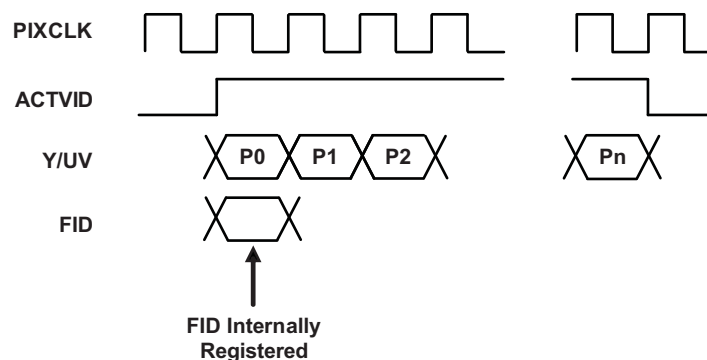

Figure 11-37. FID Registering When Using ACTVID

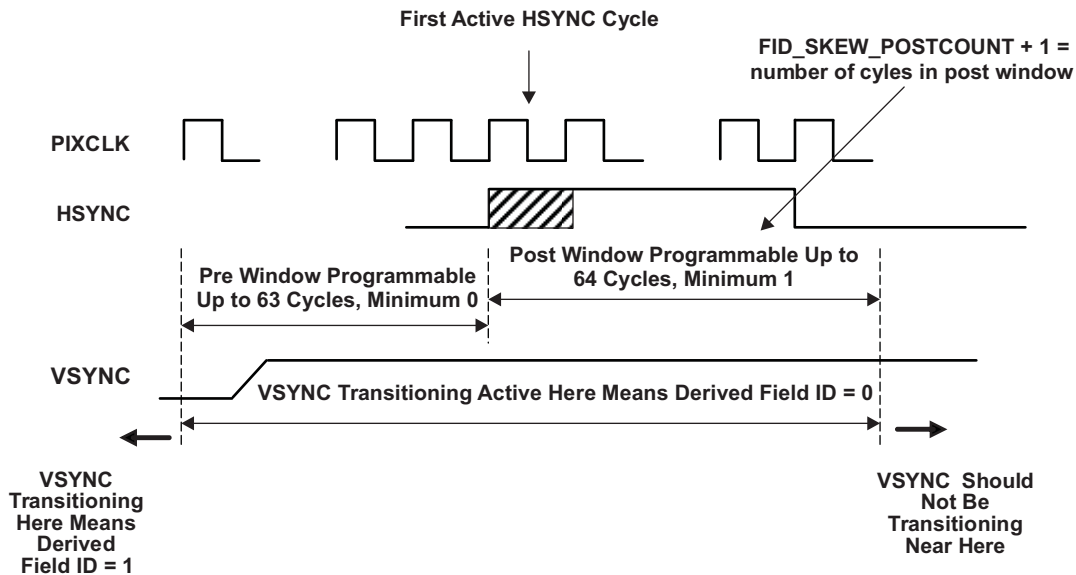

11.4.5.6.10 Field ID Determination Using VSYNC Skew

In order to save a device pin, there is a case where a skew may be inserted into VSYNC (with respect to HSYNC) when HSYNC is used as a start of line indicator as described in [Figure 11-33](#). In this case, no FIELD ID signal is sent by the source chip. A description of Field ID determination by VSYNC skew is shown in [Figure 11-38](#).

The active polarity of VSYNC falling within n pixel clock cycles of the first active cycle of HSYNC indicates the field id. If VSYNC is active before this time window, then the `FIELD_ID` = '1' for the next picture. If VSYNC becomes active within this window, then `FIELD_ID` = '0' for the next picture.

Figure 11-38. Field ID Determination By VSYNC Skew

When using FID determination by VSYNC skew, the value for VSYNC is also determined by transitions in the window as shown in [Figure 11-35](#).

The VIP_PARSER supports a configuration FID_POLARITY bit within [VIP_PORT_A](#) and [VIP_PORT_B](#) registers. For FID determination by VSYNC Skew, the fid determination functions are described in [Table 11-9](#).

Table 11-9. Polarity Table for FID Determination By VSYNC Skew

FID_POLARITY	Transition in Pre/Post Range	FID Determination
0	No	1
0	Yes	0
1	No	0
1	Yes	1

11.4.5.6.11 Rationale for FID Determination By VSYNC Skew

FID determination by VSYNC skew is a method for field ID determination derived from the analog NTSC and PAL interlaced specifications. Under this method, the sending device will not be providing a FID signal. NTSC has 525 total lines split between two fields. PAL has 625 total lines split between two fields. Each of these interlaced standards support an odd number of lines.

Let's consider just the 525 active line NTSC signal. For the sake of consistency, let's call Line 1 the first line of the 2-field pair and Line 525 the last line of the 2-field pair.

Figure 11-39. Example of 525-line FID Determination By VSYNC Skew

A waveform is shown in [Figure 11-39](#). VSYNC is defined to go active at the same time as HSYNC for the first line of the first field in a two-field picture pair. For this first field, VSYNC will go inactive after Line 20.

For the second field, VSYNC will go active in the middle of Line 263 to signal that Line 264 is the start of a vertical blanking interval. When HSYNC for Line 264 arrives, coinciding with the vertical blanking interval for the beginning of the second field, VSYNC has already been active for half of Line 263. For the second field, VSYNC will go inactive midway through Line 282 to indicate that Line 283 is active video. When HSYNC for Line 283 appears, VSYNC has already been inactive for half a line.

By seeing whether VSYNC transitions at the beginning of a line or whether it transitions at the midway point of a line, one can determine whether the upcoming group of lines represents the first field or the second field. The derived FID is shown in dashed lines.

The analog NTSC specification defines the field ID changing part way into the vertical blanking. That is, the first few lines of vertical blanking belong to the previous field and the next several lines of vertical blanking belong to the upcoming field. The VIP_PARSER saves one channel of the entire vertical blanking interval between two active video fields into a single buffer. The hardware does not discriminate between whether the vertical blanking lines belong to the bottom of the previous field or those belonging to the start of the next field. This usage model is consistent with vertical ancillary data capture for embedded sync mode of operation.

Obviously, FID Determination by VSYNC skew cannot be used when framing does not use the VSYNC signal but rather relies on the ACTVID signal instead.

11.4.5.6.12 ACTVID Framing

Instead of an HSYNC signal, the VIP_PARSER can use ACTVID framing as described in [Figure 11-32](#). Under ACTVID Framing, VSYNC is used to separate vertical blanking lines from active video lines.

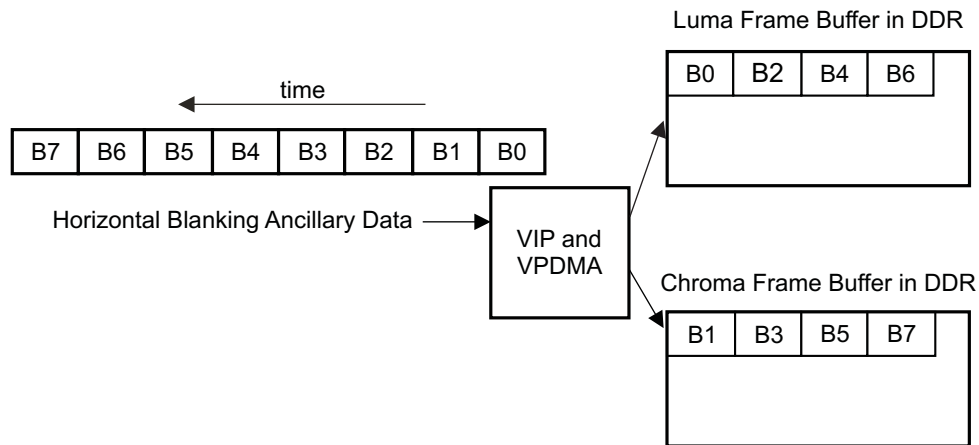

FID determination by VSYNC Skew is not allowed for ACTVID framing because there is no HSYNC input signal in this mode. Also, the VSYNC transition window is not employed. VSYNC is captured at the first pixel of each ACTVID grouping of pixels. Lines are separated by ACTVID transitioning inactive.

11.4.5.6.13 Ancillary Data Storage in Discrete Sync Mode

Ancillary data appearing in horizontal blanking is called Horizontal Blanking Ancillary Data. Ancillary Data in vertical blanking is called Vertical Blanking Ancillary Data.

Horizontal Blanking Ancillary Data is not commonly used. For the ACTVID data valid mode described in [Figure 11-31](#), there is no way to capture Horizontal Blanking Ancillary Data. Using the HSYNC mode in [Figure 11-33](#), all blanking pixels are captured. However, the horizontal ancillary data is byte-by-byte distributed between the Luma and Chroma frame buffers. Chroma sited bytes are saved in the Chroma frame buffer and Luma sited bytes are saved in the Luma frame buffer. Some CPU effort would be needed in order to extract ancillary data from the desired Luma or Chroma channel frame buffers. Also, the video on each line starts after the horizontal blanking period. This situation is shown in [Figure 11-40](#).

Figure 11-40. Horizontal Ancillary Data Packing When HSYNC Used as Sync Signal

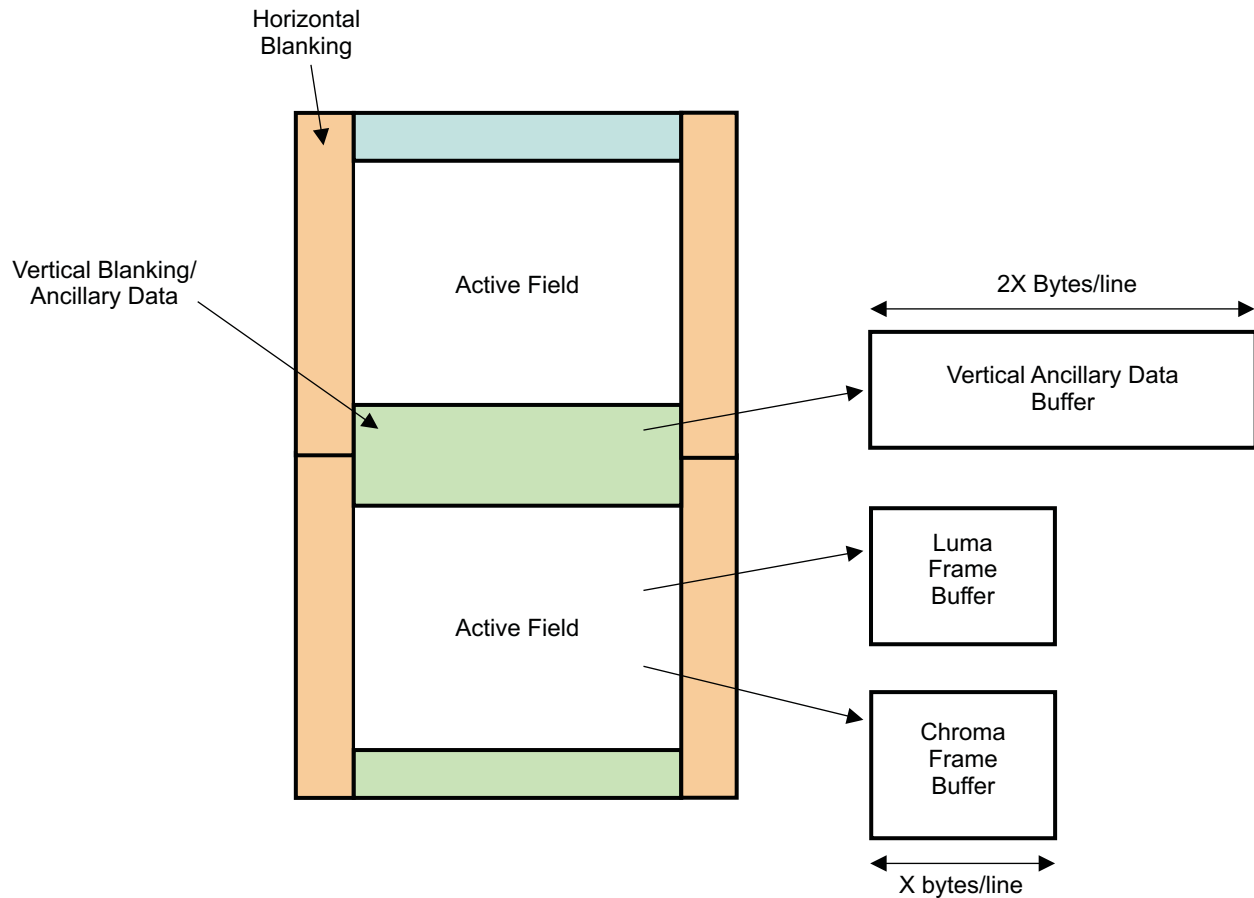

With Interlaced source material, Vertical Blanking Ancillary data will be stored in a separate Vertical Ancillary Data Buffer as shown in Figure 11-41. The Channel from which vertical ancillary data is extracted is a configuration option. For an input image of x active pixels per line, each line of Vertical Blanking Ancillary Data will have x bytes. Unlike the horizontal case, the CPU parsing this Ancillary Data will see a contiguous section of Vertical Ancillary Data that is not intermixed with Video data.

Figure 11-41. Interlaced Field Vertical Blanking Ancillary Data Storage

For Progressive source video, the FIELD ID does not change. So, the Vertical Ancillary Data Buffer will contain all the information beginning from the vertical blanking of the previous frame. This situation is shown in Figure 11-42.

Figure 11-42. Progressive Frame Vertical Blanking Ancillary Data Storage

11.4.5.7 BT.656 Style Embedded Sync

11.4.5.7.1 Data Input

Like Discrete Sync Input, Embedded Sync mode takes data from the 24b input bus. Input data can be 8, 16, or 24 bits wide. A sample is retrieved each and every Pixel Clock cycle. There is no valid signal gating data entry. [Figure 11-43](#) shows a valid data sample each Pixel Clock period.

Figure 11-43. Embedded Sync Data Entry

11.4.5.7.2 Sync Words

In embedded sync mode, code words are inserted into the stream at pixel clock rates. For external devices that send out 10 bits (single pixel interface) or 20 bits (parallel Y-Cb/Cr interface) of data, only the 8 (single pixel interface) or 16 (parallel 8bY-8bCb/Cr interface) most significant bits of each pixel are used.

The key code words are Start of Active Video (SAV) and End of Active Video (EAV). Three flags are found in these code words: F (field), V (vertical sync), and H (horizontal sync). These flags signify the position in the frame corresponding to the data immediately following the codeword. The flags determine whether the code is EAV or SAV and where they lie in the picture. The first byte of the code word is 0xFF. The second and third bytes are 0x00. The bit ordering of the fourth byte is detailed in [Table 11-10](#).

Table 11-10. Fourth Byte of EAV/SAV Code Word

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (P3=V^H)	2 (P2=F^H)	1 (P1=F^V)	0 (P0=F^V^H)	Description
1	0	0	0	0	0	0	0	SAV, Field 0, Active Video
1	0	0	1	1	1	0	1	EAV, Field 0, Horizontal Blanking
1	0	1	0	1	0	1	1	SAV, Field 0, Vertical Blanking
1	0	1	1	0	1	1	0	EAV, Field 0, Horizontal Blanking in Vertical Blanking Region
1	1	0	0	0	1	1	1	SAV, Field 1, Active Video
1	1	0	1	1	0	1	0	EAV, Field 1, Horizontal Blanking
1	1	1	0	1	1	0	0	SAV, Field 1, Vertical Blanking
1	1	1	1	0	0	0	1	EAV, Field 1, Horizontal Blanking in Vertical Blanking Region

An example of the input ordering of the embedded code word, followed by active video, is shown in [Figure 11-44](#). The input data mode is 8 bits for the example.

Figure 11-44. Code Word Format Example Followed by Video Data

11.4.5.7.3 Error Correction

The FVH flags are sent with four protection bits to support double error detection, single error correction. A non-correctable detected error is simply ignored. An option exists for the protection bits to correct a single bit error in the FVH flags. The correction table is shown in [Table 11-11](#). n/c means that the error condition is detected, but it is non-correctable.

Table 11-11. Error Correction Matrix

P3, P2, P1, P0	F, V, and H Flags							
	000	001	010	011	100	101	110	111

11.4.5.7.4 Embedded Sync Ancillary Data

With Embedded Sync streams, only Vertical Ancillary Data can be extracted. The Vertical Ancillary Data buffer is the same width as the corresponding Luma and Chroma buffers. The channel from which Vertical Ancillary Data is extracted is a configuration option.

Horizontal Ancillary data cannot be extracted using embedded sync mode.

The Vertical Ancillary Data is captured starting from the end of the previous active video. See [Figure 11-45](#) for a more detailed description of embedded sync packing.

Figure 11-45. Embedded Sync Packing

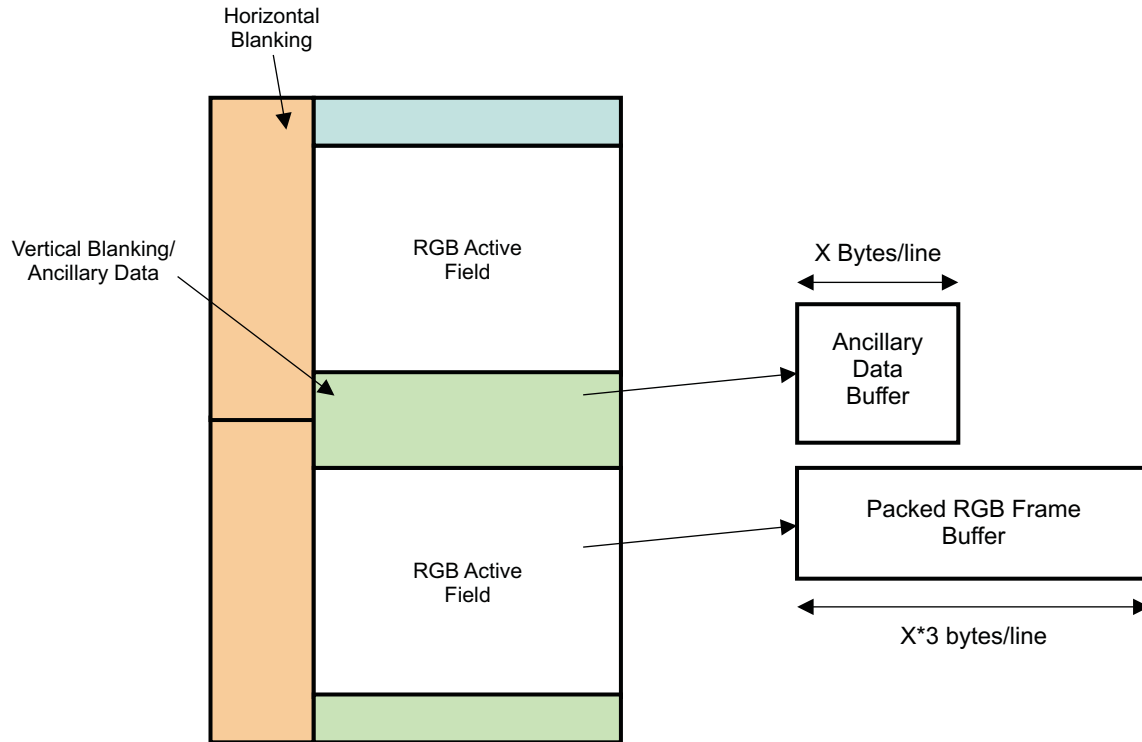

11.4.5.7.5 Embedded Sync RGB 24-bit Data

YUV streams are separated into a planar Luma buffer, a planar Chroma Pair (CbCr) buffer, and a planar Vertical Ancillary Data buffer. RGB streams, on the other hand, are stored in a packed R-G-B format, as shown in [Figure 11-46](#).

The BT.1120 standard defines a method of carrying RGB streams. After the SAV code, 8 bits of R, 8 bits of G, and 8 bits of B data are clocked in one cycle. A 24 bit data bus is required. The channel in which to search for the embedded sync codes and the FVH control code is determined by a configuration selection. Only vertical ancillary data from one channel (R, G, or B), which happens to be the channel where control codes are found, are captured. Vertical ancillary data in the other two channels are ignored.

Figure 11-46. RGB Frame Storage

11.4.5.8 Source Multiplexing

11.4.5.8.1 Multiplexing Scenarios

Some applications require multiple camera sources to be used at the same time. For this type of device, one solution would be to support N-number of 8-bit or 16-bit data interfaces for each of N cameras. However, this solution does not efficiently minimize pin count. One set of 8-bit or 16-bit interfaces has the bandwidth to support more than one video source, depending on the resolution of the video. [Table 11-12](#) is explanatory only and shows the number of sources that can be multiplexed in one VIP for 8-bit and 16-bit interface modes. Note that it does not reflect the capabilities of the VIP_PARSER. In addition, the interface pixel clock rates are shown. The VPDMA limits 16 camera sources to be saved to DDR memory per Pixel Clock Input Domain.

Table 11-12. Multiplexing Configurations and Pixel Clock Rates

	Maximum Channels in Single 16-bit Data Interface Mode	Maximum Channels in Dual 8-bit Data Interface Mode - Interleaved Channels per Single 8-bit Port. One 16-bit VIP can be configured to support two such 8-bit ports.	Interface Clock Rate (MHz)
HD Interlaced	2	1	148.5
D1 Interlaced	8	4	108.1
CIF Interlaced	n/a	n/a	n/a
HD Progressive	1	n/a	148.5
D1 Progressive	4	2	108.1
CIF Progressive ⁽¹⁾	32	16	162.2

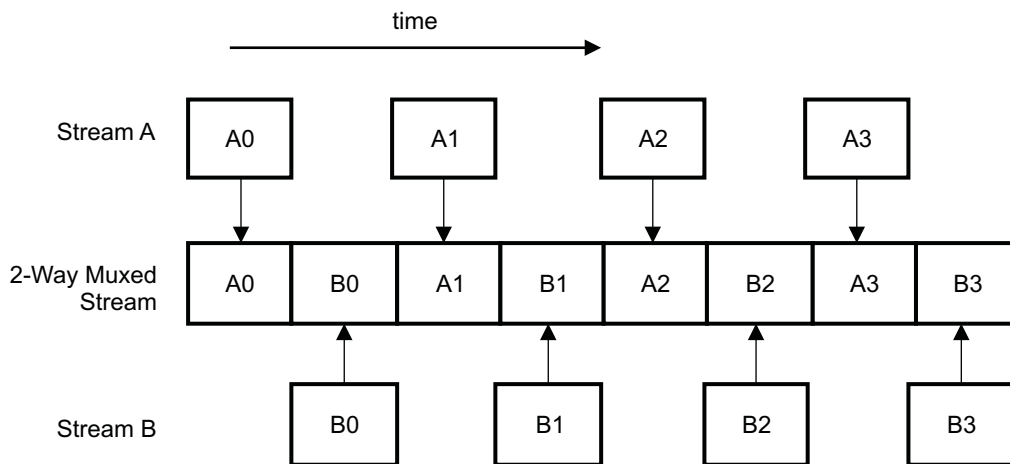

⁽¹⁾ Blanking pixels are not used in the CIF clock rate calculations. Addition of blanking pixels would require a slightly higher clock rate.

NOTE: These Channel Density values reflect one VIP subsystem.

11.4.5.8.2 2-Way Multiplexing

For 2-Way Multiplexing, two embedded sync streams are interleaved a pixel at a time as shown in Figure 11-47.

Figure 11-47. 2-Way Multiplexing

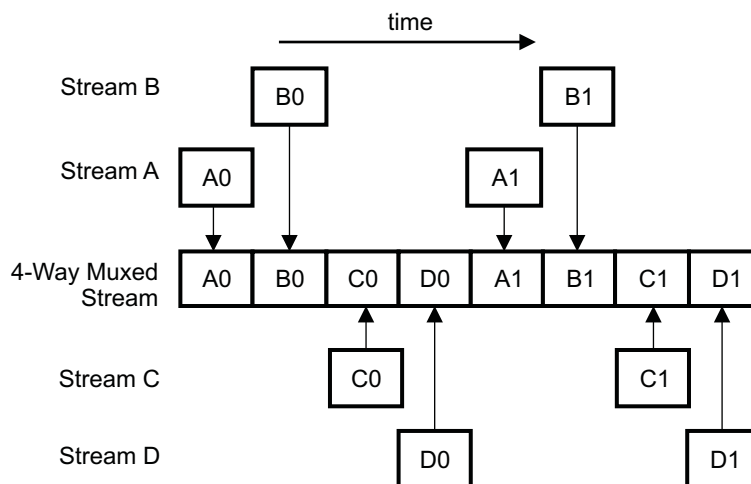

The sync codeword, FF-00-00-XY, is replicated in both source streams. In 2-Way Multiplexing, the sizes of both camera sources must be the same. Likewise, the Vertical Ancillary Data size for both sources must be identical. However, the two streams are not necessarily sending the same pixel site in adjacent clock cycles.

11.4.5.8.3 4-Way Multiplexing

For 4-Way Multiplexing, four embedded sync streams are multiplexed into one as seen in Figure 11-48.

Again, the sync codeword is in all four sources. Like 2-Way Multiplexing, the sizes of the four camera sources are the same and the sizes of the Vertical Ancillary Data regions are the same. The four streams are not necessarily sending the same pixel site in adjacent clock cycles.

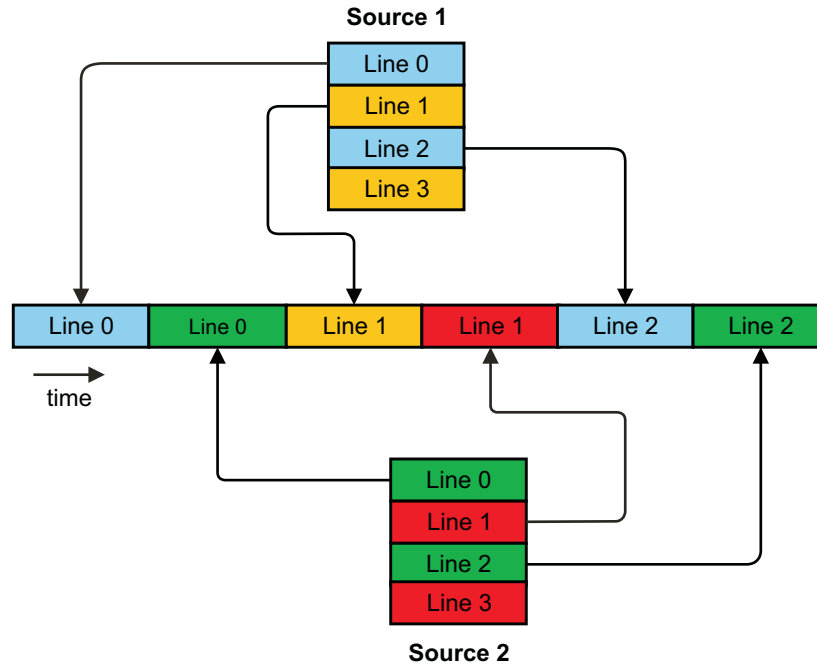

Figure 11-48. Example of 4-Way Multiplexing

11.4.5.8.4 Line Multiplexing

In Line Multiplexing, n-different sources are sent into the VIP a complete line at a time using a modified version of embedded sync. An example of Line Multiplexing for two sources is shown in Figure 11-49.

Figure 11-49. Example of Line Multiplexing

The width and height of each source in Line Multiplexed data can be different. For instance, one source can be PAL while another one can be NTSC. A line is comprised of YUV422 pixels in repeating patterns of CbYCrY.

11.4.5.8.5 Super Frame Concept in Line Multiplexing

Different camera sources are interleaved on a line-by-line basis. The beginning of each line carries a Metadata tag that provides key information about that line. This Metadata tag is preceded by a SAV codeword in which F=0, V=0, and H=0.

At the end of the line, an EAV code is inserted with an appropriate number of padding pixels following it. This EAV code has F=0, V=0, and H=1. The startcodes used for the Metadata wrapped lines and the dummy lines form the Super Frame. The VIP_PARSER module has logic to parse out the super frame, analyze the Metadata tags, and frame buffer the line contents appropriately.

11.4.5.8.6 8-bit Data Interface in Line Multiplexing

Figure 11-50 is an example of an 8-bit line multiplexing interface. Channel Data is the CbYCrY sequence representing a line. Preceding Channel Data is the four byte Meta Data tags. Note that the Meta Data bytes are replicated in both the Luma and the Chroma sites. The entire structure is bounded by a traditional SAV/EAV code in which the V flag is 0.

Figure 11-50. 8-bit Line Mux Interface

11.4.5.8.7 16-bit Data Interface in Line Multiplexing

Figure 11-51 describes the 16-bit line multiplexing interface. Channel Data is the active line. All the Y pixels are in the Luma Channel. The CbCr pixels are in the Chroma Channel. Each cycle, a 16-bit value representing one Luma sample and one Chroma sample enters the VIP_PARSER. The Meta Data tags are replicated in both channels. Likewise, the SAV/EAV startcodes are found in both channels. The V flags for the SAV/EAV startcodes are always 0.

Figure 11-51. 16-bit Line Mux Interface

11.4.5.8.8 Split Lines in Line Multiplex Mode

Suppose an external device is sending two dissimilar sources in Line Multiplex mode. One narrower source has X pixels per line. The wider source has 2X pixels per line.

The Meta Data has provisions for the external device to split a line. The Beginning of Line (BOL) and End of Line (EOL) flags tag a split line as described in Table 11-13.

Table 11-13. Split Line Table

BOL	EOL	Function
0	0	Undefined
0	1	Line Segment is the second half of a line
1	0	Line Segment is the first half of a line
1	1	Line has not been segmented into two.

11.4.5.8.9 Meta Data

Table 11-14 shows the bitfields in the Meta Data start codes.

Table 11-14. Meta Data Layout

Byte	7	6	5	4	3	2	1	0
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC2	0	BOL	EOL	VDET	LINE_ID[10:7]			
SC1	~LINE_ID[6]	LINE_ID[6:0]						
SC0	PAD	F	V	H	P3	P2	P1	P0

BOP tags the line as a startline in a period. A period is defined as the contiguous lines in a vertical blanking period or the contiguous lines in a field or frame. For the vertical blanking period case, the vertical blanking at the bottom of the previous field or frame combined with the vertical blanking at the top of the current field or frame is combined to create one period.

EOP tags the line as an endline in a period. Figure 11-52 shows the definition of the two types of Periods as outlined by BOP and EOP.

Figure 11-52. BOP/EOP Definition of a Period

For the Split Line at the top of a Period, the BOP bit is set for both halves of the split line. Likewise, for the Split Line at the bottom of a Period, the EOP bit is set for both halves of the split line.

CH_ID is the channel ID, which tags the camera source that generated the incoming line. A maximum of 16 camera sources are support per Pixel Input Clock Domain.

LINE_ID is the line number, starting from 0 and incrementing by one for each subsequent line from the same source.

PAD is a flag which tags the line as an artificially inserted padding line. When PAD is '0', the line should be discarded.

F, V, H, P3, P2, P1, and P0 are the bits representing the normal XY code. F is the Field ID associated with line, V signals when the line is in the vertical blanking, H specifies that the line is in the Horizontal Blanking, and P3:P0 are the protection bits.

Since only active video and vertical ancillary data lines are encapsulated in the Meta Data, the H bit in the SC0 byte should never be '1'.

11.4.5.8.10 TI Line Mux Mode, Split Lines, and Channel ID Remapping

The VIP_PARSER supports a maximum of 8 different Channel IDs per Port. The Channel IDs must be in the range {0:7} (3 bits). In the source multiplex, only one source can be a split line source and have the same Channel ID as one of the non-split line sources.

This scenario involves an external NTSC decoder which supports 8 D1 cameras. The external NTSC decoder will downscale the 8 sources to SIF format. However, one camera source will be sent in the multiplex as both the downscaled version and the original D1 sized version. They will both have the same Channel ID. However, the D1 version will be sent as a split-line. The source multiplex will thus have 9 maximum streams.

The VIP_PARSER (for TI Line Mux Mode only), will left shift the Channel ID by one. Bit 0 is used as an indicator whether the Source is a split-line source or a normal non-split line source. Only one of the nine inputs can be a split line source.

Table 11-15. TI Line Mux Mode Channel ID Remapping

Source Input Channel ID	Channel ID Sent to VPDMA	
	Non-split Line	Split Line
0x0	0x0	0x1
0x1	0x2	0x3
0x2	0x4	0x5
0x3	0x6	0x7
0x4	0x8	0x9

Table 11-15. TI Line Mux Mode Channel ID Remapping (continued)

0x5	0xA	0xB
0x6	0xC	0xD
0x7	0xE	0xF

All subsequent references to the Camera Source, such as in a VPDMA return descriptor, will reference the remapped Channel ID.

The [VIP_OUTPUT_PORT_A_SRC0_SIZE](#) through [VIP_OUTPUT_PORT_A_SRC15_SIZE](#) registers for Port A, and [VIP_OUTPUT_PORT_B_SRC0_SIZE](#) through [VIP_OUTPUT_PORT_B_SRC15_SIZE](#) registers for Port B and the [VIP_OUTPUT_PORT_A_SRC_FID](#) and [VIP_OUTPUT_PORT_B_SRC_FID](#) status registers reflect the remapped Channel ID when the port is in TI Line Mux mode.

11.4.5.9 Channel ID Extraction for 2x/4x Multiplexed Source

11.4.5.9.1 Channel ID Extraction Overview

For 2-way and 4-way multiplexed source, the Channel ID is either embedded in the four protection bits inside the EAV/SAV code words or in the horizontal blanking pixel data. A configuration setting determines where the VIP_PARSER would search for the Channel ID.

11.4.5.9.2 Channel ID Embedded in Protection Bits for 2- and 4-Way Multiplexing

The four-bit channel ID is an identifier corresponding with the source number (camera) of the incoming video. As shown in [Table 11-16](#), the Channel ID is placed in the code fourth byte of the EAV/SAV code words normally used for protection bits. With 4 bits, the maximum number of sources that can be defined in this range is 16. However, only Channel IDs in the range {0:7} are supported. Obviously, error correction cannot be performed on the FVH flags since the protection bits are no longer there.

Table 11-16. Channel ID Embedded in EAV/SAV

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (ch_id[3])	2 (ch_id[2])	1 (ch_id[1])	0 (ch_id[0])	Description
1	0	0	0	Ch_id = {0:15}				SAV, Field 0, Active Video
1	0	0	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking
1	0	1	0	Ch_id = {0:15}				SAV, Field 0, Vertical Blanking
1	0	1	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking in Vertical Blanking Region
1	1	0	0	Ch_id = {0:15}				SAV, Field 1, Active Video
1	1	0	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking
1	1	1	0	Ch_id = {0:15}				SAV, Field 1, Vertical Blanking
1	1	1	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking in Vertical Blanking Region

11.4.5.9.3 Channel ID Embedded in Horizontal Blanking Pixel Data for 2- and 4-Way Multiplexing

In Horizontal Blanking and Vertical Blanking, non-ancillary data pixels should be Y=0x10 and Cb=Cr=0x80. When the Channel ID is embedded in the Horizontal Blanking for 2 and 4-way multiplexing, the lower nibbles of all Luma and Chroma pixels are replaced by the 4 bit Channel ID. This scenario is shown in [Figure 11-53](#). The maximum number of values defined by this 4-bit range is $2^4 = 16$. However, only Channel IDs in the range {0:7} are supported.

Figure 11-53. Channel ID Inserted Into Horizontal Blanking
Regular Horizontal Blanking Following EAV

Channel ID Inserted Into Horizontal Blanking Following EAV

11.4.5.10 Embedded Sync Mux Modes and Data Bus Widths

Legal combinations of Embedded Sync Mux Modes and Data Bus Widths are described in [Table 11-17](#).

Table 11-17. Valid Embedded Sync Mux Mode and Data Bus Width Combinations

	1x Mux	2x Mux	4x Mux	Line Mux
8 Bit	v	v	v	v
16 Bit	v	n/a	n/a	v
24 Bit	v	n/a	n/a	n/a

11.4.5.11 Ancillary and Active Video Cropping

One Source Number for each Port can be cropped. Cropping is available for both Ancillary Data and Active Video.

For the Vertical Ancillary Data from Port A, cropping is enabled by setting the [VIP_ANC_CROP_HORZ_PORT_A\[15\]](#) ANC_BYPASS_N bit. The Source Number from Port A that gets cropped is defined by the [VIP_ANC_CROP_HORZ_PORT_A\[31:28\]](#) ANC_TARGET_SRCNUM register. [VIP_ANC_CROP_HORZ_PORT_A\[11:0\]](#) ANC_SKIP_NUMPIX, [VIP_ANC_CROP_HORZ_PORT_A\[27:16\]](#) ANC_USE_NUMPIX, [VIP_ANC_CROP_VERT_PORT_A\[11:0\]](#) ANC_SKIP_NUMLINES, and [VIP_ANC_CROP_VERT_PORT_A\[27:16\]](#) ANC_USE_NUMLINES define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in [Figure 11-54](#).

Figure 11-54. Vertical Ancillary Data Cropping

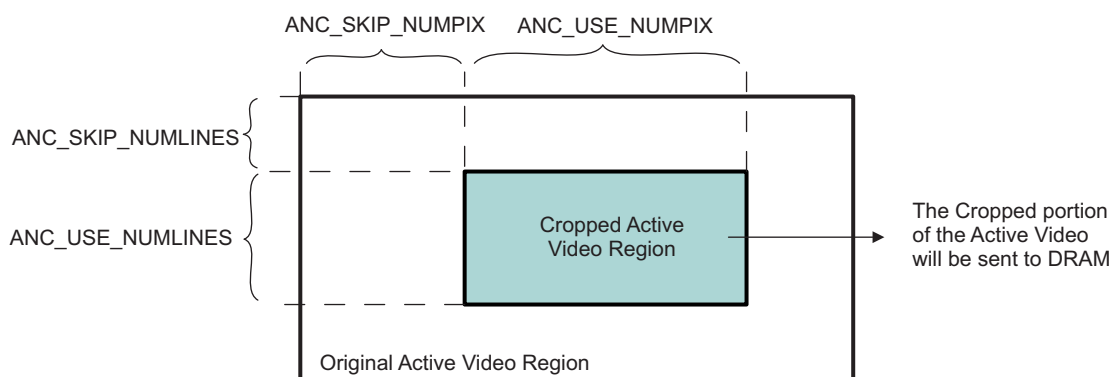

vip-00xs

Note that for 8-bit input mode only, a setting exists that allow Vertical Ancillary data from both the Luma and Chroma channels to be captured. Both channels of Vertical Ancillary Data are captured when [VIP_XTRA_PORT_A\[14:13\] ANC_CHAN_SEL_8B](#) is set to "1x". Thus, the number of data elements per line in this case is twice the equivalent number of Luma pixels per line. In other words, for this particular dual channel capture example, if there are 720 Luma pixels per line, then the total number of Vertical Ancillary Data Pixels in the source picture can be $2 \times 720 = 1440$ pixels.

For Active Video from Port A, cropping is enabled by setting the [VIP_CROP_HORZ_PORT_A\[15\] ACT_BYPASS_N](#) bit. The Source Number from Port A that gets cropped is defined by the [VIP_CROP_HORZ_PORT_A\[31:28\] ACT_TARGET_SRCNUM](#) register.

[VIP_CROP_HORZ_PORT_A\[11:0\] ACT_SKIP_NUMPIX](#), [VIP_CROP_HORZ_PORT_A\[27:16\] ACT_USE_NUMPIX](#), [VIP_CROP_VERT_PORT_A\[11:0\] ACT_SKIP_NUMLINES](#), and [VIP_CROP_VERT_PORT_A\[27:16\] ACT_USE_NUMLINES](#) define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in [Figure 11-55](#)

Figure 11-55. Active Video Cropping

vip-00xs

Cropping for Port B works in a similar way to Port A. Since picture data is in 4:2:2 format, [ANC_SKIP_NUMPIX \(ACT_SKIP_NUMPIX\)](#) and [ANC_USE_NUMPIX \(ACT_USE_NUMPIX\)](#) must be evenly divisible by 2. If the output of [VIP_PARSER](#) is sent to a 4:2:2 to 4:2:0 converter, then [ANC_USE_NUMLINES \(ACT_USE_NUMLINES\)](#) must also be evenly divisible by 2.

Error cases in cropping occur when the crop window programmed is larger than the incoming video frame. Crop window errors normally result in the return of the crop region where the crop window overlays the incoming video frame. However, there is one problematic error cropping case, as illustrated in [Figure 11-56](#).

The programmed crop window extends below the input picture and the last pixel of the input picture is not a part of the selected crop region. In this case, at the last pixel of the last line in the green crop output, there is no way to determine that this pixel is the last pixel of the cropped output.

Figure 11-56. Problematic Error Cropping Case

vip-00x

In this case, the crop tool sends out a single pixel with an endline and endframe when it reaches the last pixel of the input picture. If the green cropped region has n lines, the actual output from the crop tool will have $n+1$ lines and the width of the last line will be 1 pixel.

Figure 11-57 shows the endline (EL) and endframe (EF) signals corresponding to the last line of the cropped region. At the last line and last pixel of the cropped region, the crop tool will only output an endline. It cannot output an endframe at this point because the crop tool might get another line from the streaming input.

Later, on the same input line, the last pixel of the input frame appears. Here, the crop tool knows that the cropped region has ended. In this case, a single endline/endframe pixel is sent out to signal that the frame has ended.

NOTE: There is no interrupt to notify that application level that a crop error has occurred.

Figure 11-57. Endline/Endframe Behavior for Error Cropping Case

vip-00x

11.4.5.12 Interrupts

The VIP_PARSER module has 19 interrupts out of which one can be mapped to VIP top level.

When an interrupt occurs and is determined to be from the VIP_PARSER module, the VIP_PARSER level of masks, clears, and status registers must be checked and updated first.

[Table 11-18](#) describes each of the interrupts events supported by the VIP_PARSER, together with associated Interrupt Mask ([VIP_FIQ_MASK](#)), Interrupt Clear ([VIP_FIQ_CLEAR](#)), and Interrupt Status ([VIP_FIQ_STATUS](#)) registers.

Table 11-18. VIP_PARSER Interrupt Events

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[21] PORT_A_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[21] PORT_A_YUV_PROTOCOL_VIOLATION_MASK	PrtBDisableComplete	When a port is running and VIP_PORT_B[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port B following a disable.
VIP_FIQ_STATUS[20] PORT_A_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[20] PORT_A_ANC_PROTOCOL_VIOLATION_MASK	PrtADisableComplete	When a port is running and VIP_PORT_A[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port A following a disable.
VIP_FIQ_STATUS[19] PORT_B_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[19] PORT_B_YUV_PROTOCOL_VIOLATION_MASK	PrtBANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port B.
VIP_FIQ_STATUS[18] PORT_B_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[18] PORT_B_ANC_PROTOCOL_VIOLATION_MASK	PrtBYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port B.
VIP_FIQ_STATUS[17] PORT_A_CFG_DISABLE_COMPLETE	VIP_FIQ_MASK[17] PORT_A_CFG_DISABLE_COMPLETE_MASK	PrtAANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port A.
VIP_FIQ_STATUS[16] PORT_B_CFG_DISABLE_COMPLETE_CLR	VIP_FIQ_MASK[16] PORT_B_CFG_DISABLE_COMPLETE_MASK	PrtAYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port A.
VIP_FIQ_STATUS[15] PORT_B_SRC0_SIZE_STATUS	VIP_FIQ_MASK[15] PORT_B_SRC0_SIZE	PrtBSrc0Size	The output size for Srcnum=0 on Port B differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[14] PORT_A_SRC0_SIZE_STATUS	VIP_FIQ_MASK[14] PORT_A_SRC0_SIZE	PrtASrc0Size	The output size for Srcnum=0 on Port A differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[13] PORT_B_DISCONN_STATUS	VIP_FIQ_MASK[13] PORT_B_DISCONN	PrtBDisconn	Port B Link Disconnect for Srcnum 0
VIP_FIQ_STATUS[12] PORT_B_CONN_STATUS	VIP_FIQ_MASK[12] PORT_B_CONN	PrtBConn	Port B Link Connect for Srcnum 0
VIP_FIQ_STATUS[11] PORT_A_DISCONN_STATUS	VIP_FIQ_MASK[11] PORT_A_DISCONN	PrtADisConn	Port A Link Disconnect for Srcnum 0
VIP_FIQ_STATUS[10] PORT_A_CONN_STATUS	VIP_FIQ_MASK[10] PORT_A_CONN	PrtAConn	Port A Link Connect for Srcnum 0
VIP_FIQ_STATUS[9] OUTPUT_FIFO_PRTB_ANC_STATUS	VIP_FIQ_MASK[9] OUTPUT_FIFO_PRTB_ANC_OF	OpPrtBAnc	Overflow at Ancillary Data VPDMA interface for the Port B
VIP_FIQ_STATUS[7] OUTPUT_FIFO_PRTB_LUMA_STATUS	VIP_FIQ_MASK[7] OUTPUT_FIFO_PRTB_YUV_OF	OpPrtBYUV	Overflow at Luma VPDMA interface for Port B

Table 11-18. VIP_PARSER Interrupt Events (continued)

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[6] OUTPUT_FIFO_PRTA Anc STATUS	VIP_FIQ_MASK[6] OUTPUT_FIFO_PRTA Anc OF	OpPrtAAnc	Overflow at Ancillary Data VPDMA interface for the Port A
VIP_FIQ_STATUS[4] OUTPUT_FIFO_PRTA LUMA STATUS	VIP_FIQ_MASK[4] OUTPUT_FIFO_PRTA YUV OF	OpPrtAYUV	Overflow at Luma VPDMA interface for Port A
VIP_FIQ_STATUS[3] ASYNC_FIFO_PRTB STATUS	VIP_FIQ_MASK[3] ASYNC_FIFO_PRTB_OF	InPrtB	Overflow at Input Async FIFO for Port B
VIP_FIQ_STATUS[2] ASYNC_FIFO_PRTA STATUS	VIP_FIQ_MASK[2] ASYNC_FIFO_PRTA_OF	InPrtA	Overflow at Input Async FIFO for Port A
VIP_FIQ_STATUS[1] PRTB_VDET_STATUS	VIP_FIQ_MASK[1] PRTB_VDET_MASK	PrtBVdet	Video Detect Interrupt for Port B
VIP_FIQ_STATUS[0] PRTA_VDET_STATUS	VIP_FIQ_MASK[0] PRTA_VDET_MASK	PrtAVdet	Video Detect Interrupt for Port A

A '1' in the Status register associated with an Interrupt source shows that the interrupt source is pending. The Status register is read-only. To clear a bit in the Status register, the associated bit in the Clear register must be written with a '1.'

A '1' in the bit position of the Mask register associated with an Interrupt source ensures that the hardware interrupt will never be passed on to the VIP top level. A '0' in the bit position of the Mask register associated with an Interrupt source will cause the interrupt controller to see a VIP_PARSER interrupt in the event the hardware in the parser triggers it.

A '1' in the bit position of the Clear register associated with an Interrupt source clears the hardware interrupt status register until the next time the hardware triggers it. After a Clear, the CPU should set the bit back to a '0.' Otherwise, the hardware would not be able to set any subsequent interrupts of the same type.

11.4.5.13 VDET Interrupt

For Line Multiplexing Embedded Sync mode only, the Meta Data Header includes a Video Detect (VDET) flag. The device sets this VDET flag whenever NTSC or PAL sync is found. Some other external devices using Line Multiplexing mode may not use VDET. However, when VDET changes, a VDET interrupt is issued (see [Table 11-18, Interrupts](#), for more details on the interrupt). Each Pixel Clock Input Domain (Port A and Port B) has a separate VDET interrupt.

The VDET status register is comprised of 32 bits, each bit representing the value of the VDET flag found in the meta data of the Channel ID. Bit 0 is the VDET value from Channel ID 0, Bit 1 is the VDET value from Channel ID 1, and so on. There is a separate status register for each Pixel Input Clock Domain ([VIP_PORT_A_VDET_VEC](#) and [VIP_PORT_B_VDET_VEC](#) registers).

In Line Mux mode, the meta-data field defining the srcnum is 5-bits wide. Only the last three bits of this field and the upper two bits are reserved. This bit should always be set to 1 in TI Line Mux mode.

11.4.5.14 Source Video Size

For each Pixel Input Clock Domain, status registers are available to log the last active video height and width found from 16 camera sources. There is no interrupt activated on the change in the source size in any of the input sources. These readonly registers only inform the application of the width and the height of the last active field or frame associated with each channel ID.

In 2x/4x pixel multiplexing, the four bit nibble carrying the Srcnum defines a maximum of 16 sources.

11.4.5.15 Clipping

In ITU-656/BT.1120 embedded sync streams, the values 0x00 and 0xFF are reserved for sync detection. These values are illegal in the rest of the stream. Only when the ITU-1364 standard came out to for digitally inserted vertical blanking data structures did the 0x00 and 0xFF codes get re-used in the packet synchronization structure.

The VIP_PARSER supports one configuration bit that, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the vertical ancillary data. Another configuration bit, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the active video portion of the input picture.

Generally, clipping is only desired for discrete sync input data captured from a NTSC/PAL decoder type of device which does not follow pixel range rules. For Discrete Sync input, the possibility to clip inputs to legal values exists. Clipping is desired if the picture sent to DRAM will be streamed out of the IC again using an ITU-656/BT.1120 style output port. If the picture is processed inside the SOC before it is streamed out, then the processing procedure or the output streaming hardware needs to ensure that illegal values are not in the stream.

For Embedded Sync input, illegal values should not exist except for the ITU-1364 data sync sequence 00-FF-FF. Otherwise, the VIP Parser cannot determine good EAV/SAV. In the hardware, clipping is allowed for Embedded Sync streams even though it is not particularly a useful feature.

Note that if the clipping is enabled for ancillary data, the post processing software will never be able to find a data packet sync header, since the 00-FF-FF sequence will be changed to 01-FE-FE.

For 24-bit YUV, clipping is done on each 8 bit channel. If $\text{data}[23:16] == 0xFF$, the clipped value will be 0xFE. If $\text{data}[23:16] == 0x00$, the clipped value will be 0x01. Likewise, clipping is done for data bit ranges 15:8 and 7:0

From a software point of view, clipping should never be enabled for 24-bit RGB. RGB should use the full 8-bit quantization range for each color component. The hardware, however, will clip RGB in active video, if [VIP_MAIN\[5\] CLIP_ACTIVE='1'](#). The clipping will be done on each 8-bit channel as described for 24-bit YUV.

11.4.5.16 Current and Last FID Value

The FID values for the current field or frame are reported in the Status Registers. When a new field or frame enters, the current FID values are saved into the previous FID status registers and the new FID value is loaded into the current FID register.

Following a reset, the previous and current FID status registers are set to '1.' The first two fields or frames are ignored. On the third input field or frame after a reset, the previous FID is loaded with the current FID ('1'), and the current FID is loaded with the actual FID. By the fourth field or frame after a reset, both the previous and current FID values should represent the values found in the input stream.

The FID values are reported for each camera source in both Pixel Input Clock Domains.

11.4.5.17 Disable Handling

A feature was defined for the case of single stream (either discrete sync or embedded sync) input handling where [VIP_PORT_A\[8\] ENABLE](#) for Port A and [VIP_PORT_B\[8\] ENABLE](#) for Port B is taken inactive. The single stream case was deemed more important than the multi-stream one since the output of the VIP_PARSER may be used to drive the Scaler module. The Scaler needs to work on a frame boundary (startframe to endframe) or it may lock up without a reset. The goal of the disable handling for the single stream case is to complete a field or frame of output data to the downstream module. Then, upon enabling of the port again, the system should start up properly without a need to reset the individual modules within the VIP instance.

In this scenario, suppose the VIP_PARSER has been processing a single input stream. Then, ENABLE is brought inactive. The VIP_PARSER will continue to output data downstream until it sends out an endframe pixel and the downstream module accepts the endframe pixel.

11.4.5.18 Picture Size Interrupt

Each VIP port can be set up to trigger an interrupt if the picture size varies from a pre-programmed expected picture size. This interrupt is supported only for the Active Video portion of the input video and not for the Vertical Ancillary portion. Also this interrupt is only support for source number 0 in multi channel capture.

The interrupts are named `PrtASrc0Size` and `PrtBSrc0Size`. They are described in [Table 11-18](#), *VIP_PARSER Interrupt Events*

For Port A, the expected active video picture size values are programmed in [VIP_XTRA_PORT_A\[11:0\] SRC0_NUMLINES](#) and [VIP_XTRA_PORT_A\[27:16\] SRC0_NUMPIX](#). For PortB, the expected active video picture size values are programmed in [VIP_XTRA_PORT_B\[11:0\] SRC0_NUMLINES](#) and [VIP_XTRA_PORT_B\[27:16\] SRC0_NUMPIX](#).

NOTE: Picture Size Interrupt reflects the Active Video going into the DRAM. If cropping is enabled for `Srcnum=0`, the Picture Size is the post-cropped size.

11.4.5.19 Discrete Sync Signals

External ICs generally produce discrete sync interface signals seen in [Figure 11-58](#).

VBLNK represents the vertical blanking interval. Generally, vertical blanking is at the top of a NTSC/PAL field. In certain standards, the last few lines of a field or frame are in vertical blanking in addition to the beginning few lines in the following field or frame.

VSYNC is the vertical sync indicator. VSYNC is active during a portion of the vertical blanking. For NTSC and PAL, since these standards define an odd number of lines for a field pair, VSYNC can be use in conjunction with HSYNC to determine FID polarity. Generally, VSYNC is defined to transition inactive to active sometime during vertical blanking. This signal then transitions to an inactive state before the end of vertical blanking. Certain standards define the line numbers where VSYNC transitions.

HBLNK is the horizontal blanking interval for each line. The horizontal blanking is the same number of pixels whether the line is in the active video region or in the vertical blanking region of the scan.

ACTVID is the region of a line that is active video. It is the inverse of the HBLNK signal. The number of pixels in the ACTVID region is the same for a line in vertical blanking as a line in active video. ACTVID(1) is a situation where the signal toggles in vertical blanking as well as active video. ACTVID(2) shows the signal toggling only in non-vertical blanking regions. Once ACTVID transitions active, it stays active for every PIXCLK until the end of the line.

HSYNC transitions from inactive to active for the first pixel of each line, which is a horizontal blanking pixel. HSYNC will transition to the inactive state before the end of the line. HSYNC is similar to HBLNK in that they both transition active on the same PIXCLK cycle. However, HBLNK transitions inactive at the end of the horizontal blanking period. HSYNC can transition inactive either before or after the horizontal blanking period.

Group 1 signals define the vertical separation between fields or frames. Group 2 signals define the separation between lines. One of the Group 1 signals can be tied to the VSYNC input. The ACTVID(1) and ACTVID(2) signals from Group 2 are tied to the ACTVID input. One of the other two Group 2 signals, HBLNK or HSYNC, can be tied to the HSYNC input.

VIP_PORT_A[15] USE_ACTVID_HSYNC_N for Port A and **VIP_PORT_B[15] USE_ACTVID_HSYNC_N** for Port B defines whether the line separation method uses the signal from the ACTVID or the HSYNC input of the VIP_PARSER module.

VIP_PORT_A[22] DISCRETE_BASIC_MODE for Port A **VIP_PORT_B[22] DISCRETE_BASIC_MODE** for Port B determines whether discrete sync works as described in [Section 11.4.5.6 Input Data Interface](#) or whether a “basic mode” input handler is invoked.

By choosing one signal from Group 1 and one signal from Group 2, there should be a way to capture the external data.

Figure 11-58. Generic External Sync Signals

- NOTE:**
1. VIP_PARSER module defines three discrete sync control signals: ACTVID, HSYNC, and VSYNC.
 2. In order to capture external data PIXCLK must never stop, for either horizontal or vertical blanking.

11.4.5.19.1 VBLNK and HBLNK

[Figure 11-59](#) shows VBLNK from Group 1 and HBLNK from Group 2 being used. In this case, set `USE_ACTVID_HSYNC_N=’0’` and `DISCRETE_BASIC_MODE=’0’`. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

If `DISCRETE_BASIC_MODE=’1’` is chosen, all lines including vertical blanking ones will be sent to the Active Video buffer. Since a line is delineated by HBLNK and HBLNK toggles in vertical blanking as well as active video, every incoming pixel will be save to the Active Video buffer.

Figure 11-59. vblnk and hblnk

11.4.5.19.2 VBLNK and ACTVID (1)

Figure 11-60 shows VBLNK from Group 1 and ACTVID(1) from Group 2 being used. ACTVID is toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output and Active Video will be sent out the Active Video output.

If DISCRETE_BASIC_MODE='1' is chosen, all lines will be sent to the Active Video output.

Figure 11-60. VBLNK and ACTVID (1)

11.4.5.19.3 VBLNK and ACTVID(2)

Figure 11-61 shows VBLNK from Group 1 and ACTVID(2) from Group 2 being used. ACTVID is not toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'. Since there are no line sync/clocking signals in the Vertical Blanking period, only Active Video lines will be sent to the Active Video output.

If DISCRETE_BASIC_MODE='0' is set, then the hardware will lock up as there is no way for it to determine a frame boundary.

Figure 11-61. VBLNK and ACTVID(2)

11.4.5.19.4 VBLNK and HSYNC

Figure 11-62 shows VBLNK from Group 1 and HSYNC from Group 2 being used. In this scenario, set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

Figure 11-62. VBLNK and HSYNC

11.4.5.19.5 VSYNC and HBLNK

Figure 11-63 shows VSYNC from Group 1 and HBLINK from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

Also, no automatic parsing of vertical ancillary data will be performed so the Ancillary VPI port to the VPDMA should be disabled. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Every data element strobed on the Pixel clock's active edge will be stored in the Active Video Buffer.

In [Figure 11-63](#), it is likely the HBLNK will toggle when VSYNC is active. In this case, setting `USE_ACTVID_HSYNC_N='0'` and `DISCRETE_BASIC_MODE='0'` mean that those lines appearing under the active VSYNC will be sent to the Ancillary Data Buffer. All other captured lines will be sent to the Active Video Buffer.

Figure 11-63. VSYNC and HBLNK

11.4.5.19.6 VSYNC and ACTIVID(1)

[Figure 11-64](#) shows VSYNC from Group 1 and ACTIVID(1) from Group 2 being used. ACTIVID is toggling during the VBLNK interval. ACTIVID does not necessarily toggle during VSYNC. Set `USE_ACTVID_HSYNC_N='1'` and `DISCRETE_BASIC_MODE='1'`.

Also, no automatic parsing of vertical ancillary data will be performed so there is no activity on the Ancillary VPI port to the VPDMA. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Only those pixels gated by an active ACTIVID will be saved.

Figure 11-64. VSYNC and ACTIVID(1)

11.4.5.19.7 VSYNC and ACTIVID(2)

[Figure 11-65](#) shows VSYNC from Group 1 and ACTIVID(2) from Group 2 being used. ACTIVID is not toggling during the entire VBLNK interval. Set `USE_ACTVID_HSYNC_N='1'` and `DISCRETE_BASIC_MODE='1'`.

Also, no automatic parsing of vertical ancillary data will be performed so the the Ancillary VPI port to the VPDMA should be turned off. All active video lines, since there are no vertical ancillary data lines, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Once a line starts, ACTIVID stays active for every pixel clock until the end of the line. Only those pixels gated by an active ACTIVID will be saved.

Figure 11-65. VSYNC and ACTIVID(2)

11.4.5.19.8 VSYNC and HSYNC

Figure 11-66 shows VSYNC from Group 1 and HSYNC from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

In the event that the machine is set to DISCRETE_BASIC_MODE='0', lockup will not occur as long as there is an HSYNC active transition during the time that VSYNC is active. This scenario is likely. However, if there is not at least one such transition on HSYNC, then the machine experiences a lock up. It cannot distinguish the end of one frame from the start of the next frame.

Figure 11-66. VSYNC and HSYNC

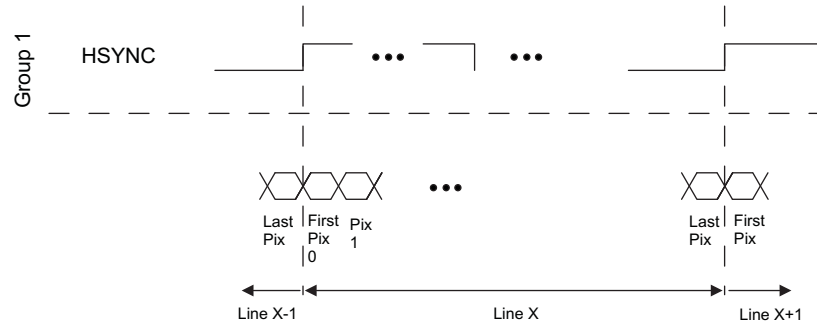

11.4.5.19.9 Line and Pixel Capture Examples

When DISCRETE_BASIC_MODE='0', VBLNK is generally used. All the lines where the start of line is under an active VBLNK are sent to the Ancillary Data buffer. All the lines where the start of line is not under an active VBLNK are sent to the Active Video framebuffer. This situation is shown in Figure 11-67.

Figure 11-67. Ancillary and Active Video Line Determination

The start of line is the pixel represented by the inactive to active transition on HSYNC when USE_ACTVID_HSYNC_N = '1'. Figure 11-68 illustrates the delineation of a line when using USE_ACTVID_HSYNC_N = '1'.

Figure 11-68. HSYNC Pixel Capture

The start of line is the pixel represented by the inactive to active transition on ACTVID when USE_ACTVID_HSYNC_N = '0.' Note that ACTVID stays active for the entire duration of active video portion of the line. This scenario is shown in [Figure 11-69](#)

Figure 11-69. ACTVID Pixel Capture

In 8-bit mode, the 4:2:2 YUV input color component order is Cb, Y followed by Cr and Y. For 16-bit and 24-bit input modes, all the components are sent in the same cycle.

11.4.5.20 VIP Overflow Detection and Recovery

It is possible that an overflow can occur in the VIP_PARSER. Overflow detection is determined by reading the [VIP_FIQ_STATUS](#) register and checking for bits 8, 7, 5, 4, 3 and 2. If video is being captured, and any of these bits are set, it indicates that not all of the incoming video data was sent to DDR memory. VIP overflow can be caused by one of the following:

1. External pixel clock is faster than processing clock
2. DDR bandwidth is temporarily over-consumed
3. VIP scaler is being used inline with external video input, and is upscaling.
 - VIP scaler in this use case can only be used for downscaling
4. VIP scaler is being used inline with external video input, but has not been configured with scaler coefficients
 - VIP scaler will not accept video input if it is not first configured with scaler coefficients. This will cause overflow
5. VIP scaler is being used inline, but has not been enabled
6. External cables are connected or disconnected while the system is running, resulting in corrupted video streams going into the VIP
7. Bad external video cable, which causes corrupted video streams going into the VIP

Items 6 and 7 above are typically seen as noise events, where it is likely that multiple horizontal syncs per line and/or multiple vertical syncs per frame will be observed. These result in high peak throughput requirements, leading to DDR bandwidth being temporarily over-consumed, and thus VIP overflow.

The high level recovery method for VIP overflow on Port A is outlined in the steps below. Port B is similar.

1. Set `VIP_XTRA6_PORT_A[31:16] YUV_SRCNUM_STOP_IMMEDIATELY = 0xFFFF_FFFF`
2. Set `VIP_XTRA6_PORT_A[15:0] ANC_SRCNUM_STOP_IMMEDIATELY = 0xFFFF_FFFF`
3. Set `VIP_PORT_A[8] ENABLE = 0`
4. Set `VIP_PORT_A[7] CLR_ASYNC_FIFO_RD` and `VIP_PORT_A[6] CLR_ASYNC_FIFO_WR` to 1
5. Set `VIP_PORT_A[23] SW_RESET` to 1
6. Reset other VIP modules
 - For each module used downstream of `VIP_PARSER`, write 1 to the bit location of the `VIP_CLKC_RST` register which is connected to `VIP_PARSER`
7. Abort VPDMA channels
 - Write to list attribute to stop list 0
 - Write to list address register location of abort list
 - Write to list attribute register list 0 and size of abort list
8. Set `VIP_PORT_A[23] SW_RESET` to 0
9. Un-reset other VIP modules
 - For each module used downstream of `VIP_PARSER`, write 0 to the bit location of the `VIP_CLKC_RST` register which is connected to `VIP_PARSER`
10. (Delay)
11. SC coeff downloaded (if `VIP_SCALER` is being used)
12. (Delay)
13. Set `VIP_XTRA6_PORT_A[31:16] YUV_SRCNUM_STOP_IMMEDIATELY = 0x0000_0000`
14. Set `VIP_XTRA6_PORT_A[15:0] ANC_SRCNUM_STOP_IMMEDIATELY = 0x0000_0000`
15. Set `VIP_PORT_A[8] ENABLE = 1`
16. Set `VIP_PORT_A[7] CLR_ASYNC_FIFO_RD` and `VIP_PORT_A[6] CLR_ASYNC_FIFO_WR` to 0

11.4.6 VIP Color Space Converter (CSC)

The Color Space Converter (CSC) module is used to convert video data from one color space to another with nine programmable integer multipliers.

11.4.6.1 CSC Features

- All parameters are programmable
- Each parameter is configurable in signed 13-bits
- Support for Bypass Mode

11.4.6.2 CSC Functional Description

The conversion between the different color spaces requires addition and multiplication operations on color and intensity components. The mathematical expression of the conversion can be written as:

$$\begin{aligned}
 Y &= A0 * R + B0 * G + C0 * B + D0 \\
 Cb &= A1 * R + B1 * G + C1 * B + D1 \\
 Cr &= A2 * R + B2 * G + C2 * B + D2
 \end{aligned}$$

Color space coefficients are set through the following registers:

- For luma component:
 - `VIP_CSC00[12:0] A0`
 - `VIP_CSC00[28:16] B0`

- VIP_CSC01[28:16] C0
- VIP_CSC04[27:16] D0
- For Cb component:
 - VIP_CSC01[28:16] A1
 - VIP_CSC02[12:0] B1
 - VIP_CSC02[27:16] C1
 - VIP_CSC05[11:0] D1
- For Cr component :
 - VIP_CSC03[12:0] A2
 - VIP_CSC03[27:16] B2
 - VIP_CSC04[12:0] C2
 - VIP_CSC05[27:16] D2

Using YUV to RGB conversion as an example: YUV represents one color space and RGB represents another color space. The conversion can be written in the matrix format shown in [Figure 11-70](#).

Figure 11-70. Matrix Format

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} A0 & B0 & C0 \\ A1 & B1 & C1 \\ A2 & B2 & C2 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} D0 \\ D1 \\ D2 \end{bmatrix}$$

Since HDTV and SDTV have different conversion requirements, both conversions of RGB-to-YCbCr and YCbCr-to-RGB are described. The details of derivations of these matrixes will be given in the following subsections.

11.4.6.2.1 HDTV Application

11.4.6.2.1.1 HDTV Application with Video Data Range

The two equations presented in this section are for the HDTV application. The chromaticity parameters are defined by ITU-R709 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 11-71. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.2126 & 0.7152 & 0.0722 \\ -0.1172 & -0.3942 & 0.5114 \\ 0.5114 & -0.4646 & -0.0468 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 11-72. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.5396 \\ 1 & -0.1831 & -0.4577 \\ 1 & 1.8142 & 0 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -197 \\ 82 \\ -232 \end{bmatrix} D$$

11.4.6.2.1.2 HDTV Application with Graphics Data Range

The two equations presented in this section are for the HDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R709 standard.

The input data ranges for these equations are as follows.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 11-73. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.1826 & 0.6142 & 0.0620 \\ -0.1006 & -0.3385 & 0.4392 \\ 0.4392 & -0.3990 & -0.0402 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 11-74. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1644 & -0.0003 & 1.7927 \\ 1.1644 & -0.2132 & -0.5329 \\ 1.1642 & 2.1125 & -0.0001 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -248 \\ 77 \\ -289 \end{bmatrix} D$$

11.4.6.2.1.3 Quantized Coefficients for Color Space Converter in HDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for HDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

Table 11-19. Quantized Coefficients of HDTV Application with Video Data Range

Conversion from RGB to YCbCr					Conversion from YCbCr to RGB			
Coefficient Names	Registers	Real Number Format	Quantized Format	Hex Format	Coefficient Names	Real Number Format	Quantized Format	Hex Format

11.4.6.2.2 SDTV Application

11.4.6.2.2.1 SDTV Application with Video Data Range

The two equations presented in this section are for the SDTV application. The chromaticity parameters are defined by ITU-R601 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 11-75. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.172 & -0.339 & 0.511 \\ 0.511 & -0.428 & -0.083 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 11-76. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & -0.0003 & 1.3717 \\ 1 & -0.3365 & -0.6984 \\ 1 & 1.7336 & -0.0016 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -176 \\ 132 \\ -222 \end{bmatrix} D$$

11.4.6.2.2.2 SDTV Application with Graphics Data Range

The two equations presented in this section are for the SDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R601 standard.

The input data ranges for these equations are as following.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 11-77. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.257 & 0.504 & 0.098 \\ -0.148 & -0.291 & 0.439 \\ 0.439 & -0.368 & -0.071 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 11-78. Conversion from YCbCr to RGB

11.4.6.3 CSC Bypass Mode

CSC module can be bypassed by setting [VIP_CSC05\[28\]](#) BYPASS bit-field to 1.

11.4.7 VIP Scaler (SC)

This section describes the highly optimized video resizers, SC (scalers), in the VIP modules.

11.4.7.1 SC Features

- Independent vertical and horizontal up and down scaling
- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Maximum horizontal scaling ratio only limited by output line buffer (2047 pixels)
- Scaling filter Coefficient memory download via VPI (Video Port Interface) Control interface

11.4.7.2 SC Functional Description

Scaler takes in a 10-bit YCbCr 422 video frame from an upstream module, performs vertical/horizontal scaling and outputs a YCbCr422 scaled image to a next downstream module. All configurations are done via the MMR interface except for the scaler coefficient memory configuration that is done via the common VPI control interface bus by VPDMA. Figure 11-79 shows the high-level block diagram of the scaler module.

Figure 11-79. High Level Block Diagram

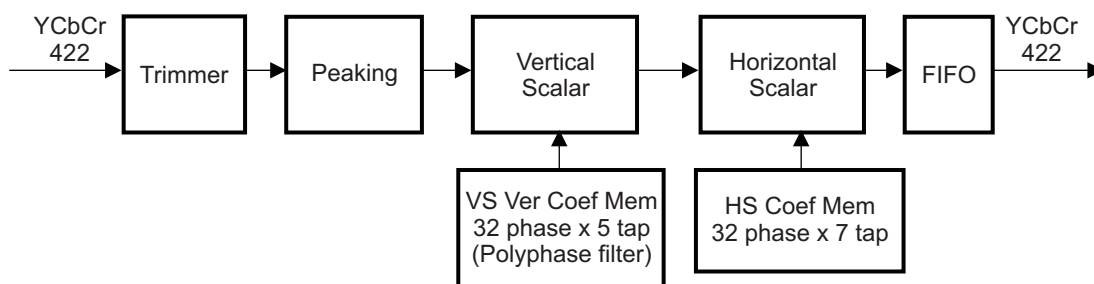

The SC is used in the video path and in all other video write-back data paths in the VIP module.

Scaling is performed in following three steps:

1. Trimming and Pre-peaking filtering
2. Vertical Scaling (Polyphase/Running Average Filter)
3. Horizontal polyphase scaling

Figure 11-80. SC Block Diagram

11.4.7.2.1 Trimmer

The trimmer can be programmed to re-define a new source image within the input video frame sent from an upstream module before it is sent to the scaling sub-modules. This feature enables small area zoom out, source pan/scan, or removal of unwanted area in the video (such as black box / curtains / noisy line-21 video) without modifying the VPDMA parameters.

Horizontal and vertical offset is set through [VIP_CFG_SC25\[26:16\] CFG_OFF_W](#) and [VIP_CFG_SC25\[10:0\] CFG_OFF_H](#) registers.

Width and height are set through [VIP_CFG_SC24\[26:16\] CFG_ORG_W](#) and [VIP_CFG_SC24\[10:0\] CFG_ORG_H](#) registers.

Figure 11-81. Input Image Trimming

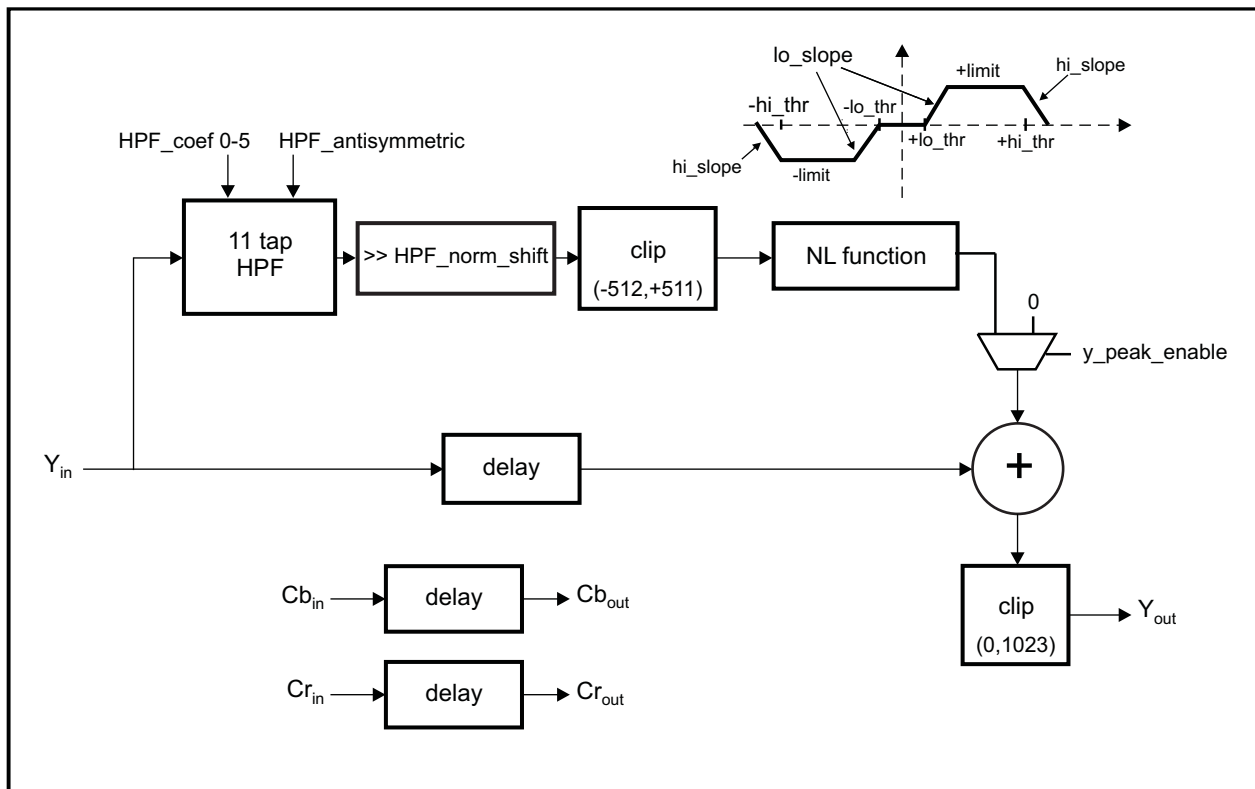

NOTE: Width and height of the source image are global parameters and are set with [VIP_CFG_SC5\[22:12\]](#) CFG_SRC_W and [VIP_CFG_SC5\[10:0\]](#) CFG_SRC_H registers.

It is required that the input image frame (CFG_SRC_W x CFG_SRC_H) to be at least 32 x 32 (after trimming, if the trimming is enabled) to properly fill the input filter stage pipelines.

11.4.7.2.2 Peaking

The peaking block increases the amplitude of high frequency luminance information in horizontal direction to increase the sharpness of a video image before it is scaled. As shown in [Figure 11-82](#), the high-frequency luminance is increased using an 11-tap High-Pass filter with adjustable gain. The non-linear coring function removes low-level noise and the modified luminance is then added to the original luminance signal. The implementation details are shown in [Figure 11-82](#).

Figure 11-82. Filter Implementation and Parameter Description

vip-057

Table 11-23. Parameter Description

Parameter	Description	Bits	Default
VIP_CFG_SC19[7:0] CFG_HPF_COEF0 to VIP_CFG_SC20[15:8] CFG_HPF_COEF5	FIR coefficients	8	[0 0 0-4 0 8]
VIP_CFG_SC20[18:16] CFG_HPF_NORM_SHIFT	Right shift	3	4
VIP_CFG_SC21[8:0] CFG_NL_LO_THR	Coring threshold	9	16
VIP_CFG_SC22[8:0] CFG_NL_HI_THR	High threshold	9	400
VIP_CFG_SC21[23:16] CFG_NL_LO_SLOPE	Lo slope = - CFG_NL_LO_SLOPE/1 6	8	16
VIP_CFG_SC22[18:16] CFG_NL_HI_SLOPE_SHIFT	Hi slope = $2^{(CFG_NL_HI_SLOPE_SHIFT-3)}$	3	4
VIP_CFG_SC20[28:20] CFG_NL_LIMIT	Clipping limit	9	200
VIP_CFG_SC0[14] CFG_Y_PK_EN	Control	1	0

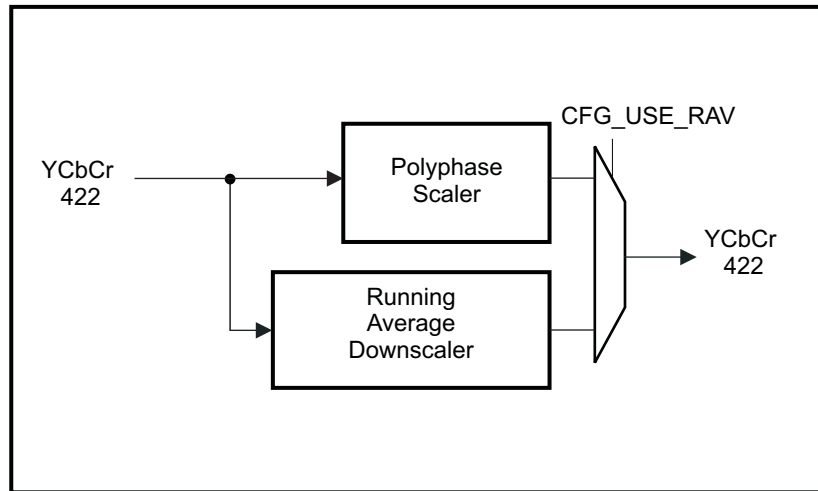

Parameters for the Peaking filters are defined in [VIP_CFG_SC19](#) through [VIP_CFG_SC22](#) registers. The frequency responses of the peaking-filter with different sets of coefficients are shown in [Figure 11-83](#). If the source of the input video is NTSC or PAL format, the peaking filter can be configured to reject the color subcarrier frequency.

Figure 11-83. Peaking Filter at fs/4

11.4.7.2.3 Vertical Scaler

The vertical scaler has a polyphase (32-phase \times 5-tap) filter and a running average filter as shown in [Figure 11-84](#). While the polyphase filter can be used for any up-scaling and preferably downscaling to 3/16 scale factor, the running average filter is used only for downscaling to a $\frac{1}{2}$ or less size. Selection between these two scalers is based on the user setting of [VIP_CFG_SC0\[4\] CFG_USE_RAV](#) parameter (CFG_USE_RAV= '0' for poliphase filter, and CFG_USE_RAV= '1' for running average filter), according to the user preference of the tradeoff between sharpness preserving and introduced artifacts.

Figure 11-84. Vertical Scaler Block Diagram

11.4.7.2.3.1 Running Average Filter

When a poly-phase filter is used, usually it has to have many taps in order to achieve acceptable quality for very small downscaling ratio, which requires the use of many line buffers. In VIP, there is a weighted Running Average filter for downscaling when the scaling factor is small (for example, when the scaling ratio is less than 0.5). This highly optimized design requires only one line buffer for luma and one for chroma, which still achieving acceptable quality. The output of the running average filter is based on weighted average of pixels in the current and previous rows in vertical direction. Initializations of accumulators affect the weights.

11.4.7.2.3.2 Vertical Scaler Configuration Parameters

Table 11-24. Vertical Scaler Configuration Parameters

Parameter	Typical Value	Controls	Description
VIP_CFG_SC0[10] CFG_INTERLACE_I		Frame or Field	0 = progressive, 1 = interlace
VIP_CFG_SC0[0] CFG_INTERLACE_O			0 = progressive 1 = interlace
VIP_CFG_SC0[3] CFG_INV_T_FID			Invert field ID input
VIP_CFG_SC0[4] CFG_USE_RAV		Scaler Mode	0 = use polyphase scaler 1 = use running average scaler
VIP_CFG_SC1[26:0] CFG_ROW_ACC_INC		Bilinear & Polyphase Scalers	For progressive in/progressive out: $\text{round}(2^{16} \cdot (\text{srcH} - 1) / (\text{tarH} - 1))$ For progressive_in/interlace_out: $\text{round}(2^{16} \cdot 2 \cdot (\text{srcH} - 1) / (2 \cdot \text{tarH} - 1))$ For interlace_in/progressive_out: $\text{round}(2^{16} \cdot (2 \cdot \text{srcH} - 1) / (2 \cdot (\text{tarH} - 1)))$ For interlace_in/interlace_out: $\text{round}(2^{16} \cdot (2 \cdot \text{srcH} - 1) / (2 \cdot \text{tarH} - 1))$ For interlace in/out, srcH/tarH are number of field lines as specified in VIP_CFG_SC4/VIP_CFG_SC5 descriptions.
VIP_CFG_SC2[27:0] CFG_ROW_ACC_OFFSET	0		Initial row accumulator value for progressive frame and top field
VIP_CFG_SC3[27:0] CFG_ROW_ACC_OFFSET_B	0		Initial row accumulator value for bottom field
VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR	4	Bilinear Scaler	Range for chroma soft switch based on pixel differences (max limit = 8)

Table 11-24. Vertical Scaler Configuration Parameters (continued)

Parameter	Typical Value	Controls	Description
VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR	64		Threshold used in chroma soft switch based on pixel differences
VIP_CFG_SC13[9:0] CFG_SC_FACTOR_RAV		Running Average Scaler	Scale factor = round($1024 \times \text{tarH}/\text{srcH}$)
VIP_CFG_SC6[9:0] CFG_ROW_ACC_INIT_RAV			Initial row accumulator value for progressive frame and top field
VIP_CFG_SC6[19:10] CFG_ROW_ACC_INIT_RAV_B			Initial row accumulator value for bottom field

NOTE: Bi-linear scaler is not present in this device

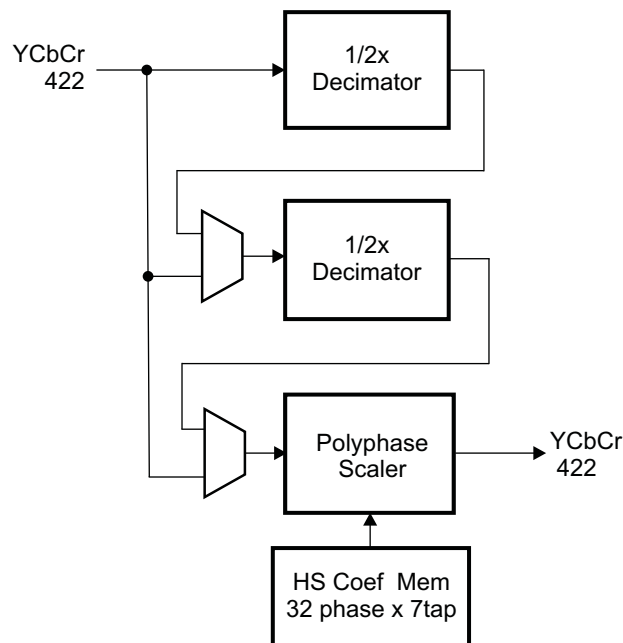

11.4.7.2.4 Horizontal Scaler

The Horizontal scaler is implemented using a 32-phase \times 7-tap polyphase filter preceded by two sets of 1/2x decimators. The general configuration of the Horizontal scaler is performed as follows:

- For up scaling, the input video is interpolated using the polyphase scaler.
- For downscaling, it is recommended that input video is decimated by 2 until the modified scale factor falls between 1/2 and 1. Then, a polyphase filter is configured with coefficients selected based on the `mod_scale_factor` calculated as shown below from one of nine different sets of coefficients: (8,9,10,11,12,13,14,15,16)/16.

```

if (scale_factor >= 1/2) {
    mux=0; mod_scale_factor=scale_factor;
} else if (scale_factor >= 1/4) {
    mux=1; mod_scale_factor=2*scale_factor;
} else {
    mux=2; mod_scale_factor=4*scale_factor;
}
    
```

Figure 11-85. Horizontal Scaler Block Diagram

In auto mode (CFG_AUTO_HS == 1), scaler will operate as per above recommendation. In addition to this, for (CFG_AUTO_HS==1), polyphase filtering will be bypassed when (scale_factor == 1) or (scale_factor == 1/2) or (scale_factor == 1/4). If CFG_AUTO_HS==0 is used, user must provide proper values for dcm_2x, dcm_4x, proper values for all inputs to polyphase filter in the registers as well as appropriate coefficient sets. There is no constraint on polyphase filtering in terms of scaling ratio. However, there are constraints on input and output image width for scaler. Frame dimensions are limited from 64x64 to 2047x2047.

11.4.7.2.4.1 Half Decimation Filter

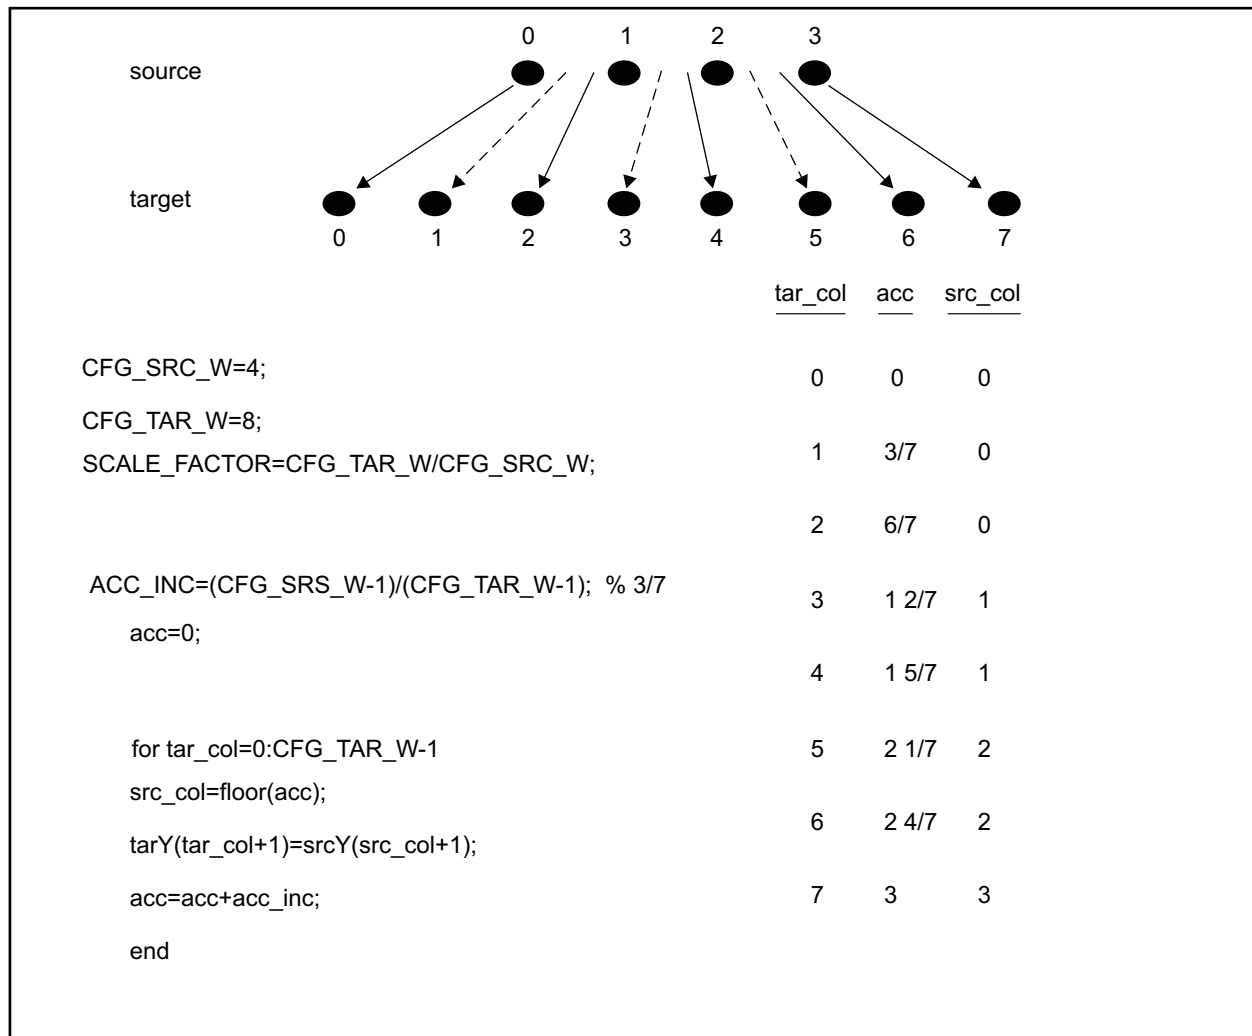

The half-decimation filter is an 11-tap filter with following coefficients: (14, 0, -29, 0, 79, 128, 79, 0, -29, 0, 14). For processing left and right edge pixels, the first and last data are repeated to pre-fill and extend the filter data pipeline respectively. These coefficients are hard-coded into scaler design and user cannot modify these.

11.4.7.2.4.2 Polyphase Filter

The horizontal scaling is done by stepping across the target row and interpolating target pixels based on source pixels. Accumulator points to the source pixel that corresponds to the target pixel.

Figure 11-86 shows an up-scaling example.

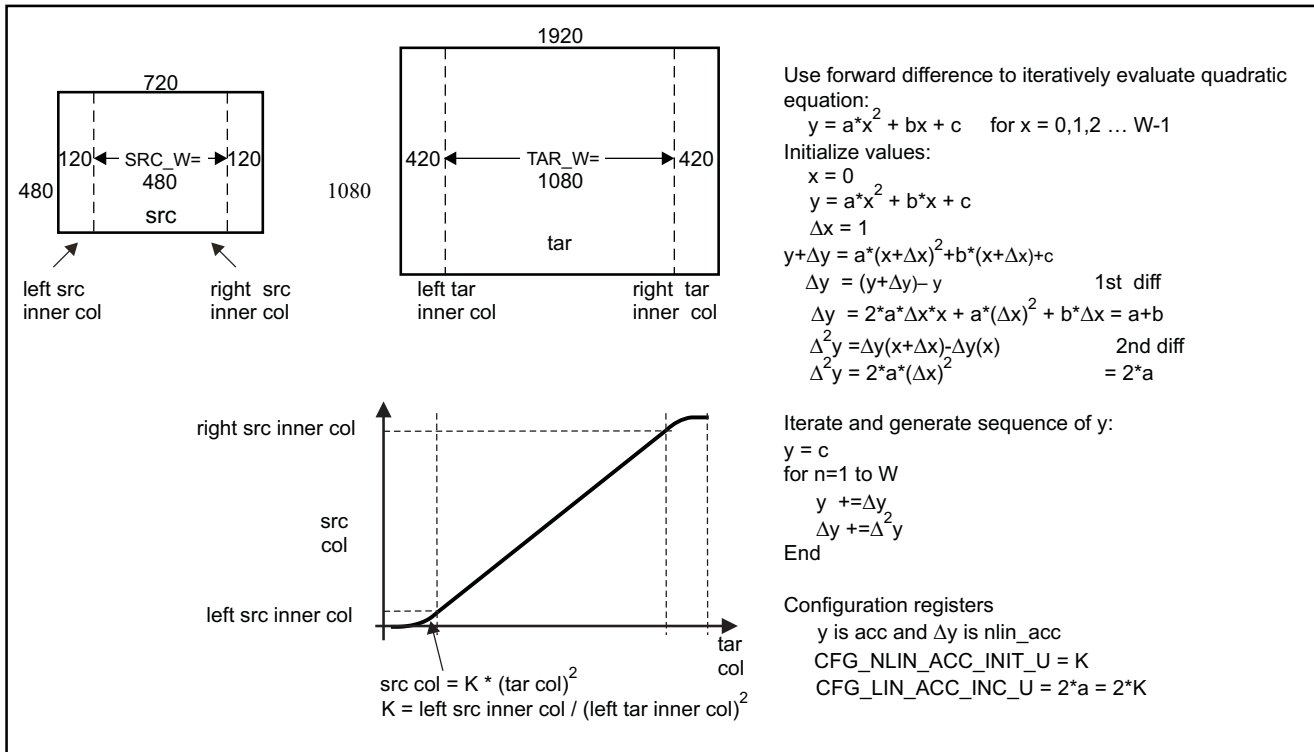

Figure 11-86. Polyphase Filtering Example

11.4.7.2.4.3 Nonlinear Horizontal Scaling

The horizontal scaler supports non-linear scaling to maintain the same aspect ratio for inner picture while stretching picture edges to fill the required resolution when capturing a 4 x 3 picture and fetching it as a 16 x 9 to memory. Non-linear scaling parameters are set with [VIP_CFG_SC4\[30:28\]](#) [CFG_NLIN_ACC_INIT_U](#) and [VIP_CFG_SC4\[26:24\]](#) [CFG_LIN_ACC_INC_U](#) registers. When setting up a non-linear scaling application, the inner picture is defined as the center square portion of the image with width and height equal to the height of the source image. Remaining side regions are then scaled non-linearly. [Figure 11-87](#) shows a non-linear scaling case.

Figure 11-87. Non-linear Scaling Example

---	---	------	-----------------------------------	---	---

11.4.7.2.6 Coefficient Memory

11.4.7.2.6.1 Overview

The scaler requires initialization of eight coefficient SRAMs prior to processing a video frame. These coefficients are stored in the external DDR memories and downloaded by the VPDMA. The VPDMA writes the coefficient data through the VPI Control Interface bus.

The eight coefficient SRAMs are:

- HS horizontal polyphase scaler, Luma and Chroma (7tap)
- VS vertical polyphase scaler, Luma and Chroma (5tap or 3tap)

11.4.7.2.6.2 Physical Coefficient SRAM Layout

Each of the six legacy coefficient SRAMs is 32 phases × 91 bits. A single coefficient value is 13 bits. Therefore, one word of the SRAM contains 7 coefficient values as shown in [Figure 11-88](#), and 224 coefficient values are stored in each SRAM.

Figure 11-88. SRAM Layout for 7tap Coefficient

Phase 0	C6	C5	C4	C3	C2	C1	C0
Phase 31	C223	C222	C221	C220	C219	C218	C217

The two vertical polyphase SRAMs are 32 phases × 65 bits. A single coefficient is 13 bits. Therefore, one word of SRAM contains 5 coefficient values as shown in [Figure 11-89](#).

Figure 11-89. SRAM Layout for 5tap Coefficient

Phase 0	C4	C3	C2	C1	C0
Phase 31	C221	C220	C219	C218	C217

Figure 11-94. VPI Control I/F Memory Map (Read)

11.4.7.2.6.5 VPI Control Interface

VPDMA is used to configure the coefficient memories of scaler through VPI control interface. Since the coefficient memories are not shadowed (unlike the memory mapped registers), VPI control write access needs to be done only during the gap between video frame processing times. If a write request is made while the Scaler is active, the access will be held off by the hardware until the last data of the currently processed frame is sent out. Care must be given to the order of the DMA descriptors so that blocking of VPI control bus does not occur.

11.4.7.2.6.6 Coefficient Table Selection Guide

The scaler filter coefficient tables are pre-generated using a MATLAB® program for various scaling factor ranges. Table 11-30 provides a general selection guide table for coefficient data files.

The mentioned .dat files are available in Section 11.4.7.4.

Table 11-30. Coefficient Data Files

11.4.7.3.2 Scaler Configuration Calculation

The following C-code shows how configuration parameters are calculated:

```

// =====
// Required Input Parameter
// =====
// srcW, srcH, tarW, tarH, srcWi, tarWi
// input/output scan modes
// Note: srcH and tarH refer to number of lines in the frame even for interlace in/out
// scaling. Based on scaling scan mode input/output scan mode option,
// heights are adjusted during internal calculations see mod_srcH and mod_tarH.

pixel_scale_factor=4; // 10 bit pixel
hor_pixel_offset =0.0

// =====
// Peaking Filter Configuration
// =====
// -----
// HPF Coef
// -----
y_peak_enable = 0;

```

```

peak_select=0; // 0=peak at fs/4  1=NTSC  2=PAL
switch(peak_select) {
case 0: { // peak at fs/4 and gain = 1

11.4.7.3.3 Typical Configuration Values

The following is the list of all scaler register fields that are set to constant values, representing typical settings:

- VIP_CFG_SC0[3] CFG_INVT_FID = 0 (Field ID will be used without inversion)
- VIP_CFG_SC0[5] CFG_ENABLE_EV = 1 (Field ID will be used without inversion)
- VIP_CFG_SC0[6] CFG_AUTO_HS = 1 (The hardware will automatically decide, if current operation is up or down scaling. In down-scaling, it will also decide, if 2X or 4X decimation filter is needed)
- VIP_CFG_SC0[7] CFG_DCM_2X = 0 (The 2X decimation filter is disabled)
- VIP_CFG_SC0[8] CFG_DCM_4X = 0 (The 4X decimation filter is disabled)
- VIP_CFG_SC0[11] CFG_ENABLE_SIN2_VER_INTP = 1 (Modified bilinear interpolation is used)
- VIP_CFG_SC0[14] CFG_Y_PK_EN = 0 (Luma peaking is disabled)
- VIP_CFG_SC0[15] CFG_TRIM = 1 (Trimming is enabled)
- VIP_CFG_SC12[24:0] CFG_COL_ACC_OFFSET = 0 (No horizontal offset is involved)
- VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR = 64 (If the difference is less than this threshold, the interpolation of chroma should be done along edge direction. Otherwise, the interpolation of chroma should be done vertically)
- VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR = 4 (max limit=8)

VIP_CFG_SC18[24:16] CFG_CONF_DEFAULT = 0x100 (Defines confidence factor when edge detection is disabled (VIP_CFG_SC0[5] CFG_ENABLE_EV bit = 0))

11.4.8 VIP Video Port Direct Memory Access (VPDMA)

11.4.8.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

11.4.8.2 VPDMA Basic Definitions

11.4.8.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VIP) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

The start event can also be selected by a channel attribute or to be controlled by an internal frame signal controlled by the List Manager.

11.4.8.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports three types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.

11.4.8.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports one kind of list only:

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the [VIP_LIST_ADDR](#) register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the [VIP_LIST_ATTR](#) register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to [VIP_LIST_ADDR](#) register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the [VIP_LIST_ATTR\[19\]](#) RDY bit after the firmware loading is complete.

11.4.8.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more information see [Section 11.4.8.9, VPDMA Data Formats](#).

- RGB Data Types:
 - RGB16-565
 - ARGB-1555
 - ARGB-4444
 - RGBA-5551
 - RGBA-4444
 - ARGB24-6666
 - RGB24-888
 - ARGB32-8888
 - RGBA24-6666
 - RGBA32-8888
 - BGR16-565
 - ABGR-1555

- ABGR-4444
- BGRA-5551
- BGRA-4444
- ABGR24-6666
- BGR24-888
- ABGR32-8888
- BGRA24-6666
- BGRA32-8888
- YUV Data Types:
 - Y 4:4:4
 - Y 4:2:2
 - Y 4:2:0
 - C 4:4:4
 - C 4:2:2
 - C 4:2:0
 - CY 4:2:2
 - YCbC 4:4:4
 - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

11.4.8.3 VPDMA Client Buffering and Functionality

Table 11-31 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 11-31. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features
vip1_lo_y	vip1_mult_porta_src0 vip1_mult_porta_src1 vip1_mult_porta_src2 vip1_mult_porta_src3 vip1_mult_porta_src4 vip1_mult_porta_src5 vip1_mult_porta_src6 vip1_mult_porta_src7 vip1_mult_porta_src8 vip1_mult_porta_src9 vip1_mult_porta_src10 vip1_mult_porta_src11 vip1_mult_porta_src12 vip1_mult_porta_src13 vip1_mult_porta_src14 vip1_mult_porta_src15 vip1_portb_luma vip1_portb_rgb	1920 (color separate) 960 (interleaved)	4096	TILED

11.4.8.4 VPDMA Channels Assignment

Table 11-32 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer descriptor. The Client field states the name of the Client and in parentheses it states the reference number in [Figure 11-4, VIP Block Diagram](#).

Table 11-32. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src0	Video Input 1 Port A Channel 0	38	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src1	Video Input 1 Port A Channel 1	39	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src2	Video Input 1 Port A Channel 2	40	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src3	Video Input 1 Port A Channel 3	41	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src4	Video Input 1 Port A Channel 4	42	YUV (0x7)	vip1_lo_y (2)

Table 11-32. VPDMA Channels Assignment (continued)

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src5	Video Input 1 Port A Channel 5	43	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src6	Video Input 1 Port A Channel 6	44	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src7	Video Input 1 Port A Channel 7	45	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src8	Video Input 1 Port A Channel 8	46	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src9	Video Input 1 Port A Channel 9	47	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src10	Video Input 1 Port A Channel 10	48	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src11	Video Input 1 Port A Channel 11	49	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src12	Video Input 1 Port A Channel 12	50	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src13	Video Input 1 Port A Channel 13	51	YUV (0x7)	vip1_lo_y (2)

11.4.8.5 VPDMA MFLAG Mechanism

The device L3_MAIN interconnect accepts MFLAG signals from certain initiators that can influence the internal L3_MAIN arbitration mechanisms. As a result, a higher priority is given to the data traffic initiated by these initiators. The VIP VPDMA can directly drive such MFLAG signals dynamically. The MFLAG generation for VIP VPDMA is enabled by default, and there is no register control over it.

The VPDMA arbitrates between multiple DMA sources within the VIP based on FIFO levels of DMA channels connected to VPDMA. Priority escalation mechanism implemented within VIP subsystem is based on overflow threshold and FIFO margin.

The following is a summary of priority and MFLAG levels provided by the VIP:

- High priority (MFLAG = 3) when FIFO margin is below 25%
- Medium priority (MFLAG = 1) when FIFO margin is between 25% and 50%
- Low priority (MFLAG = 0) when FIFO margin is above 50%

Additionally, the VIP subsystem also generates MReqPriority based upon a programmed descriptor configuration. The MReqPriority configuration influences the arbitration mechanism in the Memory Subsystem only and has no influence on the arbitration that takes place within L3_MAIN interconnect. For more information see [Section 11.4.8.7.1.4, Data Packet Descriptor Word 3](#).

11.4.8.6 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each separate interrupt group. A status register bit exists for each interrupt source for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

[Table 11-33](#) shows all interrupt events from VPDMA that go to VIP top level. The interrupt events are mapped to two interrupt lines, INT0 and INT1, that go to VIP top level.

Table 11-33. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VIP_INT0_CHANNEL0_INT_STAT VIP_INT1_CHANNEL0_INT_STAT	VIP_INT0_CHANNEL0_INT_MASK VIP_INT1_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 or 1 has fired.
vpdma_int_channel_group1	VIP_INT0_CHANNEL1_INT_STAT VIP_INT1_CHANNEL1_INT_STAT	VIP_INT0_CHANNEL1_INT_MASK VIP_INT1_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 or 1 has fired.
vpdma_int_channel_group2	VIP_INT0_CHANNEL2_INT_STAT VIP_INT1_CHANNEL2_INT_STAT	VIP_INT0_CHANNEL2_INT_MASK VIP_INT1_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 or 1 has fired.
vpdma_int_channel_group3	VIP_INT0_CHANNEL3_INT_STAT VIP_INT1_CHANNEL3_INT_STAT	VIP_INT0_CHANNEL3_INT_MASK VIP_INT1_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 or 1 has fired.
vpdma_int_channel_group4	VIP_INT0_CHANNEL4_INT_STAT VIP_INT1_CHANNEL4_INT_STAT	VIP_INT0_CHANNEL4_INT_MASK VIP_INT1_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 or 1 has fired.
vpdma_int_channel_group5	VIP_INT0_CHANNEL5_INT_STAT VIP_INT1_CHANNEL5_INT_STAT	VIP_INT0_CHANNEL5_INT_MASK VIP_INT1_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 or 1 has fired.
vpdma_int_list0_complete			List 0 has completed
vpdma_int_list0_notify			The data transfer in list 0 with the Notify Field set in the descriptor has completed
vpdma_int_list1_complete			List 1 has completed

Table 11-33. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_list1_notify			The data transfer in list 1 with the Notify Field set in the descriptor has completed
vpdma_int_list2_complete			List 2 has completed
vpdma_int_list2_notify			The data transfer in list 2 with the Notify Field set in the descriptor has completed
vpdma_int_list3_complete			List 3 has completed
vpdma_int_list3_notify			The data transfer in list 3 with the Notify Field set in the descriptor has completed
vpdma_int_list4_complete	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_MASK VIP_INT1_LIST0_INT_MASK	List 4 has completed
vpdma_int_list4_notify			The data transfer in list 4 with the Notify Field set in the descriptor has completed
vpdma_int_list5_complete			List 5 has completed
vpdma_int_list5_notify			The data transfer in list 5 with the Notify Field set in the descriptor has completed
vpdma_int_list6_complete			List 6 has completed
vpdma_int_list6_notify			The data transfer in list 6 with the Notify Field set in the descriptor has completed
vpdma_int_list7_complete			List 7 has completed
vpdma_int_list7_notify			The data transfer in list 7 with the Notify Field set in the descriptor has completed
vpdma_int_client	VIP_INT0_CLIENT0_INT_STAT VIP_INT0_CLIENT1_INT_STAT VIP_INT1_CLIENT0_INT_STAT VIP_INT1_CLIENT1_INT_STAT	VIP_INT0_CLIENT0_INT_MASK VIP_INT0_CLIENT1_INT_MASK VIP_INT1_CLIENT0_INT_MASK VIP_INT1_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	Descriptor Interrupt

In [Table 11-33](#) above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group”, “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to [Table 11-34](#) to determine what the actual interrupt was).

Table 11-34. VIP Interrupt Sources

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_ancb_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src10	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src11	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src12	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src13	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src14	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src15	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_ancb_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_porta_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src10	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src11	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_porta_src12	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src13	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src14	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src15	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.
channel_vip1_portb_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_luma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip2_mult_anc_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anc_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anc_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anc_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_ancb_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src10	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src11	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src12	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src13	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src14	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src15	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_ancb_src4	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src5	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src6	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src7	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src8	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src9	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_porta_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src10	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src11	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src12	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src13	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_porta_src14	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src15	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src4	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src5	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src6	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src7	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src8	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src9	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_portb_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_porta_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_luma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point.
channel_vip2_portb_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_luma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
client_vip1_anc_a	client	The client interface vip1_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_anc_b	client	The client interface vip1_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_uv	client	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_y	client	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
client_vip1_up_uv	client	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_y	client	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_a	client	The client interface vip2_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_b	client	The client interface vip2_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_uv	client	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_y	client	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_uv	client	The client interface vip2_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_y	client	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vpi_ctl	client	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
control_descriptor_int0	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0.
control_descriptor_int1	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1.
control_descriptor_int10	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10.
control_descriptor_int11	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11.
control_descriptor_int12	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12.
control_descriptor_int13	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13.
control_descriptor_int14	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14.
control_descriptor_int15	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15.

Table 11-34. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
control_descriptor_int2	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2.
control_descriptor_int3	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3.
control_descriptor_int4	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4.
control_descriptor_int5	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5.
control_descriptor_int6	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6.
control_descriptor_int7	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7.
control_descriptor_int8	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8.
control_descriptor_int9	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9.
list0_complete	list0_complete	List 0 has completed
list0_notify	list0_notify	The data transfer in list 0 with the Notify Field set in the descriptor has completed
list1_complete	list1_complete	List 1 has completed
list1_notify	list1_notify	The data transfer in list 1 with the Notify Field set in the descriptor has completed
list2_complete	list2_complete	List 2 has completed
list2_notify	list2_notify	The data transfer in list 2 with the Notify Field set in the descriptor has completed
list3_complete	list3_complete	List 3 has completed
list3_notify	list3_notify	The data transfer in list 3 with the Notify Field set in the descriptor has completed
list4_complete	list4_complete	List 4 has completed
list4_notify	list4_notify	The data transfer in list 4 with the Notify Field set in the descriptor has completed
list5_complete	list5_complete	List 5 has completed
list5_notify	list5_notify	The data transfer in list 5 with the Notify Field set in the descriptor has completed
list6_complete	list6_complete	List 6 has completed
list6_notify	list6_notify	The data transfer in list 6 with the Notify Field set in the descriptor has completed
list7_complete	list7_complete	List 7 has completed
list7_notify	list7_notify	The data transfer in list 7 with the Notify Field set in the descriptor has completed

11.4.8.7 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

- i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.
- ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller
- iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

11.4.8.7.1 Data Transfer Descriptors

In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 11-95. Inbound Data Transfer Descriptor Format

	31:24						23:16						15:8			7:0		
Word 0	Data Type	Notify	Field	1D	Even Line Skip	RSV	Odd Line Skip	Line Stride

Figure 11-96. Outbound Data Transfer Descriptor Format

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word 0	Data Type			Notify	Field	1D	Reserved	Even Line Skip	Reserved	Odd Line Skip	Line Stride																					
Word 1	Reserved																															
Word 2	Start Address																															
Word 3	Packet Type	Mode	Dir	Channel				NoReject	Reserved	Pri	Next Channel																					
Word 4	Descriptor Write Address																								Reserved	write descriptor	Reserved					
Word 5	Reserved																								Max Width	Reserved	Max Height					
Word 6	Reserved																															
Word 7	Reserved																															

The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8 × 32bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

11.4.8.7.1.1 Data Packet Descriptor Word 0 (Data)
Table 11-35. Data Packet Descriptor Word 0 Field Descriptions

Bit	Field	Value	Description
31:26	Data Type		Miscellaneous Channel Sets the pixel size in bits plus 1
			RGB Channel
		0	RGB16-565
		1h	ARGB-1555
		2h	ARGB-4444
		3h	RGBA-5551
		4h	RGBA-4444
		5h	ARGB24-6666
		6h	RGB24-888
		7h	ARGB32-8888
		8h	RGBA24-6666
		9h	RGBA32-8888
		10h	BGR16-565
		11h	ABGR-1555
		12h	ABGR-4444
		13h	BGRA-5551
		14h	BGRA-4444
		15h	ABGR24-6666
		16h	BGR24-888
		17h	ABGR32-8888
		18h	BGRA24-6666
		19h	BGRA32-8888
			YUV Channel
		0	Y 4:4:4
		1	Y 4:2:2
		2	Y 4:2:0
		4	C 4:4:4
		5	C 4:2:2
		6	C 4:2:0
		7	CY 4:2:2
		8	YCbC 4:4:4
		14h	Cb 4:4:4
15h	Cb 4:2:2		
16h	Cb 4:2:0		
17h	CbY 4:2:2		
27h	YC 4:2:2		
37h	YCb 4:2:2		
25	Notify	0-1	Send List Notification Interrupt upon last transfer of this channel
24	Field	0-1	Field Value
23	1D	0	The transfer is one dimensional. The transfer and frame sizes are combined to make a single 32 bit transfer size. For writes this value is passed to the generated descriptor. This feature is not supported by all clients. Only clients that support the feature will recognize this bit. Note: 1D mode is not supported by VIP modules

Table 11-35. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
15:0	Line Stride	0-FFFFh	Address stride between lines in bytes

11.4.8.7.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in [Table 11-36](#) and [Table 11-37](#);
- For a BGRA data type, the B component would be in the LSB location;

Table 11-36. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 11-37. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in [Table 11-38](#) and [Table 11-39](#). The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 11-38. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 11-39. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

[Table 11-40](#) shows the proper settings required for RGB data types for both storage schemes.

Table 11-40. VPDMA Descriptor RGB Data Type Mapping

Source/Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	Column A Source data stored in the VPDMA defined order	Column B Source data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In [Table 11-40](#), if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.
- To capture and write out a RGB24-888 image in the memory with R in the LSB, the data type in the

descriptor should be set to 0x16 (this case assumes the VIP VIN d[23:0] data input is mapped to RGB bus with B component in the LSB).

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

Table 11-41 shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 11-41. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UVY	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYYV (YUV422I_UYYV)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see ⁽¹⁾)
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see ⁽¹⁾)

⁽¹⁾ If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to [Section 11.4.8.9, VPDMA Data Formats](#).

11.4.8.7.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

11.4.8.7.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

11.4.8.7.1.1.4 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

11.4.8.7.1.1.5 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

11.4.8.7.1.1.6 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

11.4.8.7.1.2 Data Packet Descriptor Word 1

Table 11-42. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

11.4.8.7.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

11.4.8.7.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

11.4.8.7.1.3 Data Packet Descriptor Word 2

Table 11-43. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0] If Mode is TILED, then TILER specific ADDRESS Map is used: Bits 31-29: 0 0-degree view 1h 180-degree view + mirroring 2h 0-degree view + mirroring 3h 180-degree view 4h 270-degree view + mirroring 5h 270-degree view 6h 90-degree view 7h 90-degree view + mirroring Bits 28-27: 0 8-bit container 1h 16-bit container 2h 32-bit container 3h Page Mode If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

11.4.8.7.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

11.4.8.7.1.4 Data Packet Descriptor Word 3

Table 11-44. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 11.4.8.7.1.4.5, Priority , for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

11.4.8.7.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

11.4.8.7.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

11.4.8.7.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers from an internal buffer to an external location (outbound).

11.4.8.7.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

11.4.8.7.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

11.4.8.7.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

11.4.8.7.1.5 Data Packet Descriptor Word 4

11.4.8.7.1.5.1 Inbound data

Table 11-45. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

11.4.8.7.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

11.4.8.7.1.5.1.2 Frame Height

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

11.4.8.7.1.5.2 Outbound data

Table 11-46. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

11.4.8.7.1.5.2.1 Descriptor Write Address

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

11.4.8.7.1.5.2.2 Write Descriptor

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

11.4.8.7.1.5.2.3 Drop Data

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit, no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written.

11.4.8.7.1.6 Data Packet Descriptor Word 5

11.4.8.7.1.6.1 Outbound data

Width and Height are set in the following register bit-fields:

- For Max_Size1: [VIP_MAX_SIZE1](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE1](#)[15:0] MAX_HEIGHT registers
- For Max_Size2: [VIP_MAX_SIZE2](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE2](#)[15:0] MAX_HEIGHT registers
- For Max_Size3: [VIP_MAX_SIZE3](#)[31:16] MAX_WIDTH and [VIP_MAX_SIZE3](#)[15:0] MAX_HEIGHT registers

Table 11-47. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	<p>The maximum allowable pixels per line. 0: Unlimited Line Size</p> <p>1: Use Max_Size1 Max Width field 2: Use Max_Size2 Max Width field 3: Use Max_Size3 Max Width field 4: 352 pixels 5: 768 pixels 6: 1280 pixels 7: 1920 pixels Others: Reserved</p>
2:0	Max Height	<p>The maximum allowable lines per frame. 0: Unlimited Frame Size</p> <p>1: Use Max_Size1 Max Height field 2: Use Max_Size2 Max Height field 3: Use Max_Size3 Max Height field 4: 288 lines 5: 576 lines 6: 720 lines 7: 1080 lines Others: Reserved</p>

11.4.8.7.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger than 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

11.4.8.7.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

11.4.8.7.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 × 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

11.4.8.7.2.1 Configuration Descriptor Header Word0

Table 11-48. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

11.4.8.7.2.2 Configuration Descriptor Header Word1

Table 11-49. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

11.4.8.7.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

11.4.8.7.2.3 Configuration Descriptor Header Word2

Table 11-50. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

11.4.8.7.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

11.4.8.7.2.4 Configuration Descriptor Header Word3

Table 11-51. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

11.4.8.7.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

11.4.8.7.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

11.4.8.7.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger than the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

11.4.8.7.2.4.3.1 Address Data Block Format

Table 11-52. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

11.4.8.7.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 11-53. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
7	VIP Slice 0	VIP Slice 0 Scaler Coefficient Tables
8	VIP Slice 1	VIP Slice 1 Scaler Coefficient Tables

11.4.8.7.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

11.4.8.7.3 Control Descriptor

11.4.8.7.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

11.4.8.7.3.2 Control Descriptor Header Description

Table 11-54. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

11.4.8.7.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

11.4.8.7.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

11.4.8.7.3.2.3 Control

The Control field defines the specific function of the descriptor. [Table 11-55](#) lists the different control descriptors.

11.4.8.7.3.3 Control Descriptor Types

Table 11-55. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

11.4.8.7.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 11-56. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 11-57. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

11.4.8.7.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 11-58. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

11.4.8.7.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the LIST_STAT_SYNC register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the LIST_STAT_SYNC bit for the list number that called the descriptor.

Table 11-59. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

11.4.8.7.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 11-60. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

11.4.8.7.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

11.4.8.7.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 11-61. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 11-62. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 11-63. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 11-63. Change Client Interrupt Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

11.4.8.7.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information of VPDMA interrupt events, see [Section 11.4.8.6, VPDMA Interrupts](#).

Table 11-64. Send Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

11.4.8.7.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 11-65. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 11-66. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Table 11-67. Reload List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

11.4.8.7.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 11-68. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

11.4.8.8 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

11.4.8.8.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the [VIP_LIST_ADDR\[31:0\]](#) [VIP_LIST_ADDR](#) register and then writes the [VIP_LIST_ATTR](#) register. If the NUMBER in the [VIP_LIST_ATTR\[26:24\]](#) LIST_NUM is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the [VIP_LIST_ATTR\[26:24\]](#) LIST_NUM is busy then the [VIP_LIST_ADDR](#) and [VIP_LIST_ATTR](#) registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

11.4.8.8.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

11.4.8.8.2.1 Multiplexed Data Streams

In the case of a multiplexed data stream input the channels that should be used are [VIP\(X\)_MULT_PORT\(Y\)_SRC\(Z\)](#). Where X is the specific VIP slice of the instance that wants to be used and port Y is the port A or port B that is receiving the data. Finally Z is the channel number. For Split line mux mode the LSB of the channel will determine, if the line is a split line or a complete line. This is required so that the data streams do not get mixed when a channel ends without completing a line. In this mode the data will always be sent out as 422 Interleaved data to the destination specified in the descriptor.

11.4.8.8.2 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are VIPX_PORTY_LUMA and VIPX_PORTY_CHROMA for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

11.4.8.8.3 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are VIPX_PORTY_LUMA or VIPX_PORTY_CHROMA depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

11.4.8.9 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

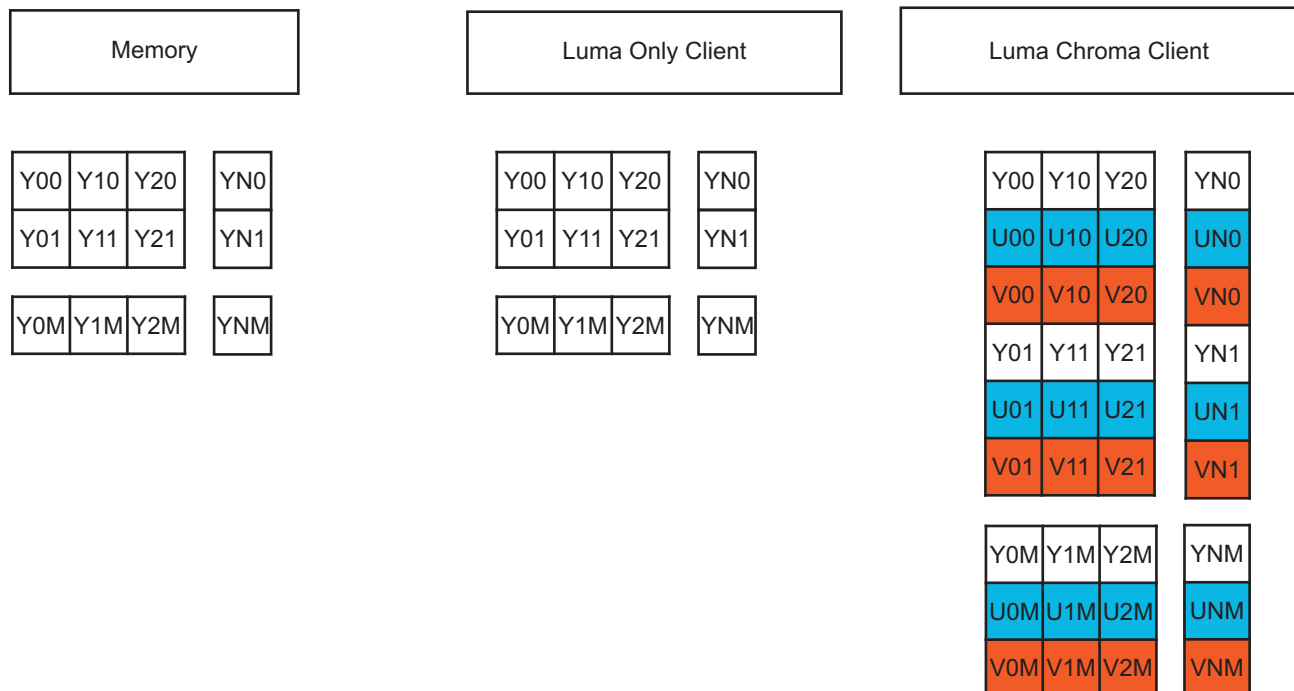

11.4.8.9.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left hand corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

11.4.8.9.1.1 Y 4:4:4 (Data Type 0)

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

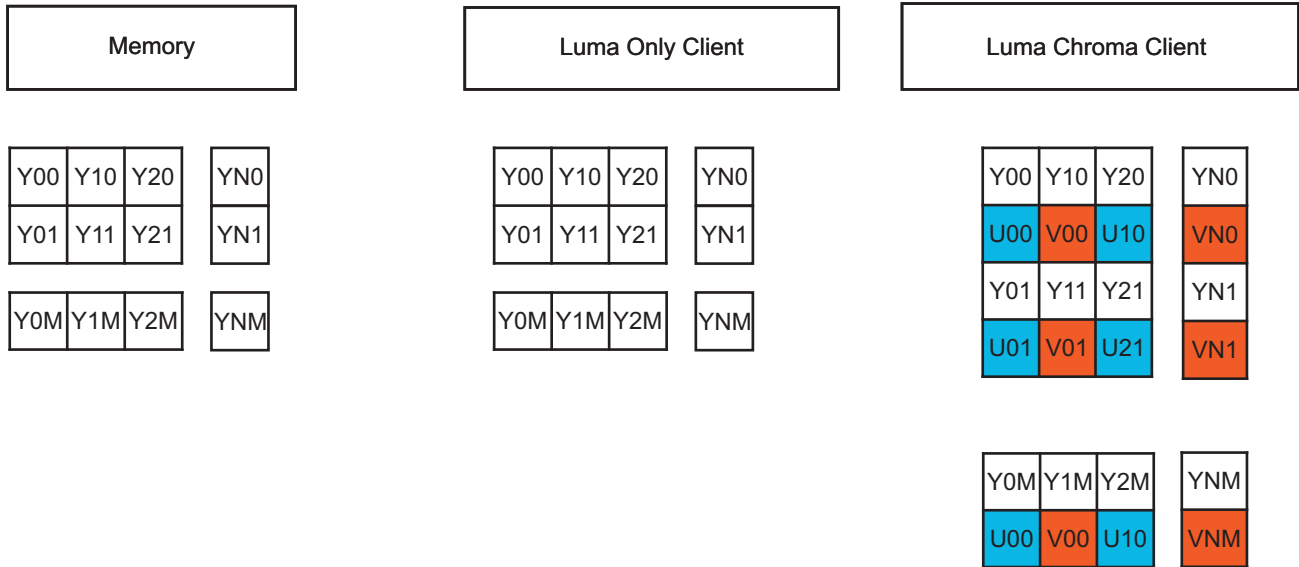

Figure 11-97. Y 4:4:4 (Data Type 0)

11.4.8.9.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

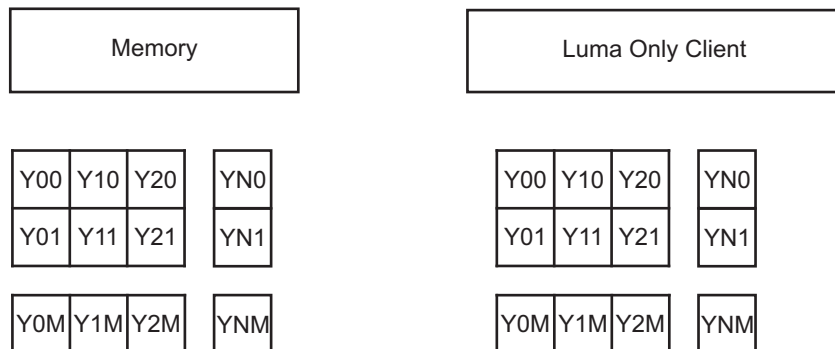

Figure 11-98. Y 4:2:2 (Data Type 1)

11.4.8.9.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 11-99. Y 4:2:0 (Data Type 2)

11.4.8.9.1.4 C 4:4:4 (Data Type 4)

The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

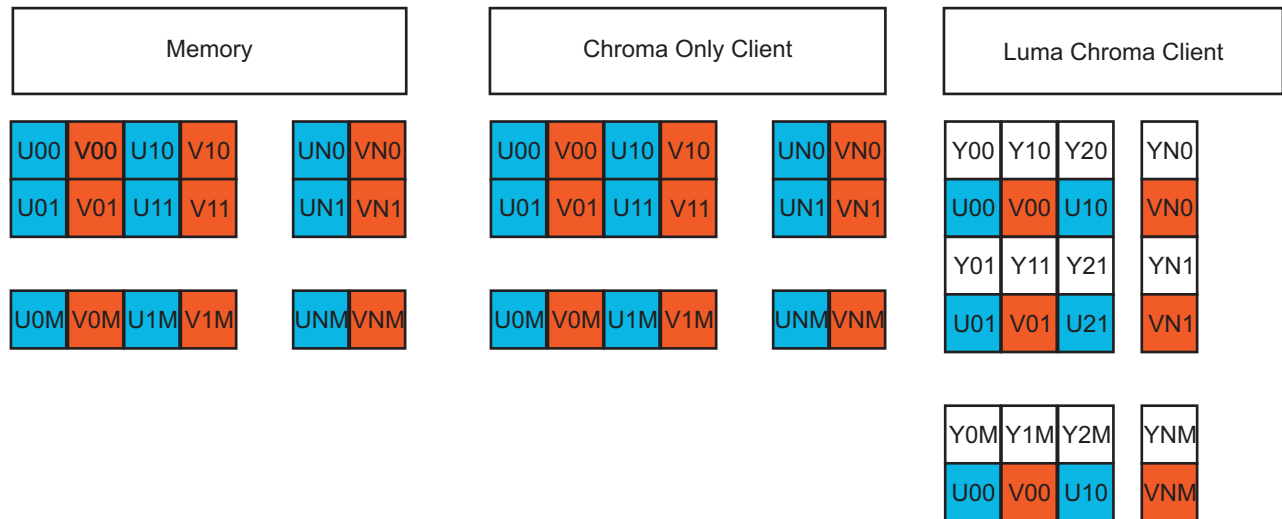

Figure 11-100. C 4:4:4 (Data Type 4)

11.4.8.9.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

Figure 11-101. C 4:2:2 (Data Type 5)

11.4.8.9.1.6 C 4:2:0 (Data Type 6)

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

Figure 11-102. C 4:2:0 (Data Type 6)

11.4.8.9.1.7 YC 4:2:2 (Data Type 7)

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 11-103. YC 4:2:2 (Data Type 7)

11.4.8.9.1.8 YC 4:4:4 (Data Type 8)

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

Figure 11-104. YC 4:4:4 (Data Type 8)

11.4.8.9.1.9 CY 4:2:2 (Data Type 23)

The CY 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Cb in the lowest byte followed by Y0 followed by Cr finally Y1 in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 11-105. CY 4:2:2 (Data Type 23h)

11.4.8.9.2 RGB Data Formats

The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less than the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

11.4.8.9.2.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 11-106. RGB16-565 (Data Type 0)

11.4.8.9.2.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 11-107. ARGB-1555 (Data Type 1)

11.4.8.9.2.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

Figure 11-108. ARGB-4444 (Data Type 2)

11.4.8.9.2.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 11-109. RGBA-5551 (Data Type 3)

11.4.8.9.2.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

Figure 11-110. RGBA-4444 (Data Type 4)

11.4.8.9.2.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 11-111. ARGB24-6666 (Data Type 5)

11.4.8.9.2.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the BG_RGB Blend value for the Blend value.

Figure 11-112. RGB24-888 (Data Type 6)

11.4.8.9.2.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

Figure 11-113. ARGB32-8888 (Data Type 7)

11.4.8.9.2.9 RGBA24-6666 (Data Type 8)

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

Figure 11-114. RGBA24-6666 (Data Type 8)

11.4.8.9.2.10 RGBA32-8888 (Data Type 9)

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 11-115. RGBA32-8888 (Data Type 9)

11.4.8.9.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

Bits	Field Name	Description	Type	Reset
15	VIP1_MULTI_CHANNEL_SELECT	Video Input Port 1 Multi Channel Select 0 : VIP_PARSER A and B channels operate in single channel mode 1 : VIP_PARSER A and B channels directly drive VPDMA (multi-channel case) Multi-Channel means that the A and B sources are from multiple channels and used in a multiplexed stream mode. The VIP Parser extracts the channel ID from each source and outputs this information to VPDMA, and thus to memory. When operating in a multiplexed stream mode, this bit must be set to 1 to enable the channel information to be passed to memory. If this is not set, the channel number (or source number) will be 0 for all streams. If vip1_rgb_out_select = 1, then VIP_PARSER A port is connected to VPDMA	RW	0x0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
ANALYZER_FVH_ERR_CORRECTION_ENABLE		ANALYZER_2X4X_SRCNUM_POS		FID_SKEW_POSTCOUNT				SW_RESET	DISCRETE_BASIC_MODE				FID_SKEW_PRECOUNT				USE_ACTVID_HSYNC_N	FID_DETECT_MODE	ACTVID_POLARITY	VSYNC_POLARITY	HSYNC_POLARITY	PIXCLK_EDGE_POLARITY	FID_POLARITY	ENABLE	CLR_ASYNC_FIFO_RD	CLR_ASYNC_FIFO_WR	CTRL_CHAN_SEL		SYNC_TYPE			

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_EN ABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port A logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable Port 1 = Enable Port	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0x0
30:28	REPACK_SEL	000 = Straight Through 001 = Cross Swap 010 = Left Center Swap 011 = Center Right Swap 100 = Right Rotate 101 = Left Rotate 110 = RAW16 to RGB565 Mapping 111 = RAW12 Swap	RW	0x0
27:16	SRC0_NUMPIX	Number of expected pixels on Source Number 0. The Port_a_src0_size interrupt will trigger if a line is encountered that differs from this pixelcount.	RW	0x0
15	RESERVED		R	0x0
14:13	ANC_CHAN_SEL_8B	In 8b mode, Vertically Ancillary Data typically resides in the Luma sites. This bit allows vertical ancillary data to be extracted from the chroma sites instead. 00 = Extract 8b Mode Vertical Ancillary Data from Luma Sites 01 = Extract 8b Mode Vertical Ancillary Data from Chroma Sites 10, 11 = Extract every single sample of vertical ancillary data. The output line is twice as wide as the other modes. For 16b and 24b inputs, ctrl_chan_sel is used to select which channel is used as a source for vertical ancillary data.	RW	0x0
12	RESERVED		R	0x0
11:0	SRC0_NUMLINES	Number of expected lines on Source Number 0. The Port_a_src0_size interrupt will trigger if a field/frame is encountered that differs from this linecount.	RW	0x0

30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port B logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

Bits	Field Name	Description	Type	Reset
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable 1 = Enable	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0
5:4	CTRL_CHAN_SEL	PORT B supports on 8b mode. Always write 0 to this field. The anc_chan_sel_8b register is used to select the Luma or Chroma channel from which Ancillary Data is taken.	RW	0x0
3:0	SYNC_TYPE	0000 = embedded sync single YUV stream 0001 = embedded sync 2x multiplexed YUV stream 0010 = embedded sync 4x multiplexed YUV stream 0011 = embedded sync line multiplexed YUV stream 0100 = discrete sync single YUV stream 0101 = embedded sync single RGB stream 0110 = reserved 0111 = reserved 1000 = reserved 1001 = reserved 1010 = discrete sync single 24b RGB stream	RW	0x0

Bits	Field Name	Description	Type	Reset
31:16	YUV_SRCNUM_STOP_IMMEDIATELY	For the Active Video Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Each bit in this vector represents a <code>srcnum</code> (remapped <code>srcnum</code> for T1 line mux mode) going to the VPDMA. For example, bit 0 is <code>srcnum 0</code> , bit 1 is <code>srcnum 1</code> , etc. A <code>?0?</code> in a bit position means that the hardware will wait for that <code>srcnum</code> , if it is in the middle of a frame, to continue until the end of the frame before stopping. A <code>?1?</code> in a bit position means that it is ok for a <code>srcnum</code> to stop in the middle of a frame. For example, suppose a source is removed and the input will never complete sending a frame. If the bit position representing that <code>srcnum</code> is set to <code>?0?</code> , the port will never disable.	RW	0x0
15:0	ANC_SRCNUM_STOP_IMMEDIATELY	For the Ancillary Data Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following <code>cfg_enable</code> transitioning inactive for that port. Each bit in this vector represents a <code>srcnum</code> (remapped <code>srcnum</code> for T1 line mux mode) going to the VPDMA. For example, bit 0 is <code>srcnum 0</code> , bit 1 is <code>srcnum 1</code> , etc. A <code>?0?</code> in a bit position means that the hardware will wait for that <code>srcnum</code> , if it is in the middle of a frame, to continue until the end of the frame before stopping. 11.5.4.2 VIP CSC Register Description

Table 11-240. VIP_CSC00

Address Offset	0x0000 0000	Instance	VIP1_Slice0_csc VIP1_Slice1_csc VIP2_Slice0_csc VIP2_Slice1_csc VIP3_Slice0_csc VIP3_Slice1_csc
Physical Address	0x4897 5700 0x4897 5C00 0x4899 5700 0x4899 5C00 0x489B 5700 0x489B 5C00		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		RW	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. (Same format conversion as A0)	RW	0x0
15:13	RESERVED		RW	0x0
12:0	A0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. Rules for converting a real number coefficient to a 12-bit hex number for this register: - If the real number is positive, then simply multiply it by 1024, and convert the integer part to hex format. For example, 0.673 X 1024 = 689.152, then 0x2B1 should fill in to this register - If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is -1.893, by *1024 to this number, it becomes -1938. The 2'S compliment format of -1938 is 0x186E (in 13-bit width). Then 0x186E should be the number assigned to this register.	RW	0x0

Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RESERVED																CFG_FID_SELFGEN	CFG_TRIM	CFG_Y_PK_EN	RESERVED	CFG_INTERLACE_I	CFG_HP_BYPASS	CFG_DCM_4X	CFG_DCM_2X	CFG_AUTO_HS	CFG_ENABLE_EV	CFG_USE_RAV	CFG_INV_T_FID	CFG_SC_BYPASS	CFG_LINEAR	CFG_INTERLACE_O		

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	CFG_FID_SELFGEN	FID self generate enable. When input is progressive and this bit is set, the SC generates self-toggling (top/bottom) output FID when performing interlacing.	RW	0x0
15	CFG_TRIM	Trimming enable. When 1, the input image whose size is specified by orgW and orgH registers is trimmed to the size with srcW and srcH registers from the offset specified by ofW and offH. 0: disable trimming 1: enable trimming	RW	0x0
14	CFG_Y_PK_EN	This parameter is used by peaking block. 0: disable luma peaking 1: enable luma peaking	RW	0x0
13:11	RESERVED		R	0x0
10	CFG_INTERLACE_I	This parameter is used by both horizontal and vertical scaling 0: the input video format is progressive 1: the input video format is interlace	RW	0x0
9	CFG_HP_BYPASS	This parameter is used by horizontal scaling. If cfg_auto_hs is 0, horizontal polyphase filter is always enabled. In this case, this register is DON'T CARE. If cfg_auto_hs is 1, 0 : The polyphase scaler is always used regardless of the scaling ratio. 1 : The polyphase scaler is bypassed only when (tar_w == src_w) or (tar_w == src_w/2) or (tar_w == src_w/4)	RW	0x0
8	CFG_DCM_4X	This parameter is used by horizontal scaling. 0: the 4X decimation filter is disabled 1: the 4X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (horizontal scale ratio 0.25). (3) This register is DON'T CARE when cfg_auto_hs = 1.	RW	0x0
7	CFG_DCM_2X	This parameter is used by horizontal scaling. 0: the 2X decimation filter is disabled 1: the 2X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (0.25 horizontal scale ratio 0.5). (3) This register is DON'T CARE when cfg_auto_hs = 1.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	CFG_AUTO_HS	This parameter is used by horizontal scaling. 0: the cfg_dcm_2x and cfg_dcm_4x bits will enable appropriate decimation filters 1: HW will decide whether up-scaling or down-scaling is required based on horizontal scaling ratio (SR). SR 0.5 : horizontal polyphase filter is enabled, all decimation filters are disabled SR = 0.5 : dcm_2x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.5 SR 0.25 : dcm_2x and horizontal polyphase filter both are enabled SR = 0.25 : dcm_4x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.25 SR 0.125 : dcm_4x and horizontal polyphase filter are both enabled SR = 0.125 : Functionally supported, but not recommended in auto mode for image quality concerns	RW	0x0
5	CFG_ENABLE_EV	This parameter is used by the edge-detection block. 0: The output of edge-detection block will be force to ?0? 1: The calculation results of edge-detection block will be output normally	RW	0x0
4	CFG_USE_RAV	This parameter is used by vertical scaling. 0: Poly-phase filter will be used for the vertical scaling 1: Running average filter will be used for the vertical scaling (down scaling only)	RW	0x0
3	CFG_INV_T_FID	This parameter is used by vertical scaling. 0: Progressive input 1: Interlaced input Must be set to 1 when CFG_INTERFACE_I = 1.	RW	0x0
2	CFG_SC_BYPASS	This parameter is a general purpose. 0: Scaling module will engaged 1: Scaling module will be bypassed	RW	0x0
1	CFG_LINEAR	This parameter is used by horizontal scaling. 0: Anamorphic scaling 1: Linear scaling	RW	0x0
0	CFG_INTERLACE_O	This parameter is used by vertical scaling. 0: The output format of SC is progressive 1: The output format of SC is interlace	RW	0x0

RESERVED								CFG_ROW_ACC_INC																							

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:0	CFG_ROW_ACC_INC	This parameter is used by vertical scaling. It defines the increment of the row accumulator in vertical poly-phase filter. It can be calculated by following formula: $row_acc_inc = round(2^{16} * (src_h) / (tar_h))$ In case of interlaced input, srcH is input field height In case of interlaced output, tarH is output field height.	RW	0x0

11.5.6 VIP VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VIP VPDMA in this family of devices:

- All VIP_INT2_* registers
- All VIP_INT3_* registers

The following channels are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- HQ_*
- GRPX_*
- SCALER_OUT
- SCALER_LUMA
- SCALER_CHROMA
- NF_*
- TRANSCODE1_*
- TRANSCODE2_*
- AUX_IN
- PIP_FRAME
- POST_COMP_WR
- VBI_SD_VENC

The following clients are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these clients should be kept at their reset value.

- DEI_HQ_*
 - TRANS1_LUMA
 - TRANS1_CHROMA
 - TRANS2_LUMA
 - TRANS2_CHROMA
 - HDMI_WRBK
 - VBI_SDVENC
 - NF_420_UV_OUT
 - NF_420_Y_OUT
 - NF_420_UV_IN
 - NF_420_Y_IN
 - NF_422_IN
 - GRPX1_ST
 - GRPX2_ST
 - GRPX3_ST
 - GRPX1_DATA
 - GRPX2_DATA
 - GRPX3_DATA
 - PIP_WRBK
 - SC_IN_*
 - SC_OUT
 - COMP_WRBK
-

Table 11-300. VIP_LIST_ATTR

Address Offset	0x0000 0008	Instance	VIP1_VPDMA VIP2_VPDMA VIP3_VPDMA
Physical Address	0x4897 D008 0x4899 D008 0x489B D008		
Description	The attributes of a new list. This register should always be written after VIP_LIST_ADDR .		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				LIST_NUM			RESERVED	STOP	RDY	LIST_TYPE			LIST_SIZE																		

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at VIP_LIST_ADDR . If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VIP_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the VIP_LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated.\n0: Normal List\n1: Self-Modifying List\n2: List Doorbell\nOthers Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last read DMA transaction has occurred for channel grpx3 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx3_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last read DMA transaction has occurred for channel grpx2 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx2_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_GRPX1	The last read DMA transaction has occurred for channel grpX1 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpX1_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_HQ_VID2_LUMA	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_HQ_VID1_CHROMA	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_HQ_VID1_LUMA	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel <code>post_comp_wr</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>hdmi_wrbk_out</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel <code>vbi_sd_venc</code> and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client <code>vbi_sd_venc</code> will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel <code>nf_last_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel <code>nf_last_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel <code>nf_write_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_CONTROL_DESCRIPTOR_INT15	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_CONTROL_DESCRIPTOR_INT14	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_CONTROL_DESCRIPTOR_INT13	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_CONTROL_DESCRIPTOR_INT12	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27:20	RESERVED	Reserved	R	0x00

Bits	Field Name	Description	Type	Reset
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_STAT_HQ_VID2_LUMA	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_HQ_VID1_CHROMA	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_HQ_VID1_LUMA	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
26	INT_STAT_VIP1_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP1_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt <code>vpdma_int1</code> . Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sd_venc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel <code>nf_write_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel <code>nf_write_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel <code>vip2_portb_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_lo_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel <code>vip2_porta_rgb</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_up_y</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel <code>vip2_portb_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel <code>vip2_portb_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel <code>vip2_porta_chroma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel <code>vip2_porta_luma</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel <code>vip2_mult_ancb_src15</code> . All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client <code>vip2_anc_b</code> then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_CONTROL_DESCRIPTOR_INT15	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_CONTROL_DESCRIPTOR_INT14	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_CONTROL_DESCRIPTOR_INT13	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_CONTROL_DESCRIPTOR_INT12	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Video Processing Engine

This chapter describes the video processing engine (VPE) for the device.

Topic	Page
12.1 VPE Overview	3830
12.2 VPE Integration.....	3831
12.3 VPE Functional Description	3833
12.4 VPE Register Manual	3931

12.1 VPE Overview

VPE Features:

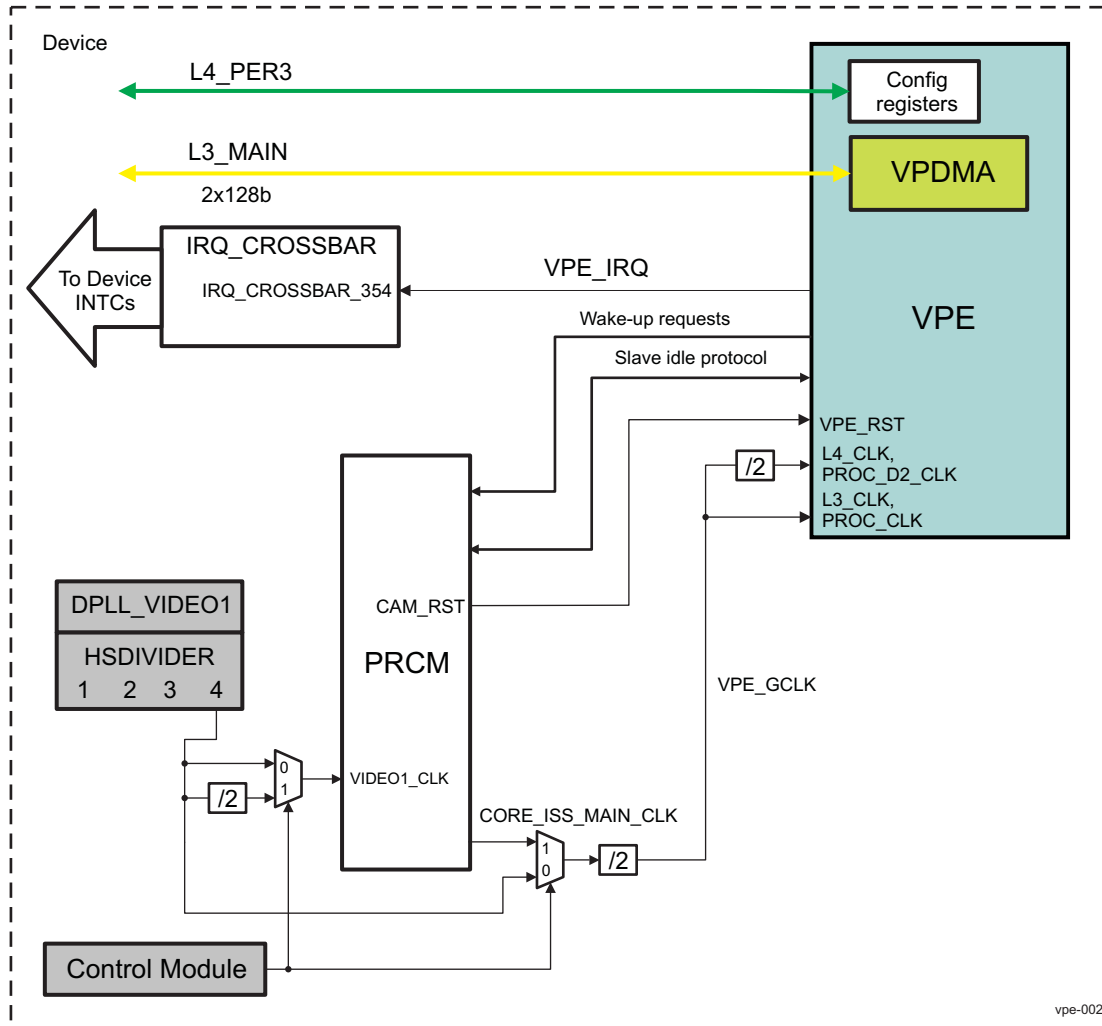

- Supports memory to memory operations only.
- VPE consist of a single memory to memory path which can perform the following operations:
 - Read of raster or tiled YUV420 coplanar, YUV422 coplanar or YUV422 interleaved video
 - Deinterlacing of the input video using a 4 field motion based algorithm
 - Scaling of the input video up to 1080p (1920x1080) resolution
 - Write of the resulting video in YUV420 coplanar (raster or tiled), YUV422 coplanar (raster or tiled), YUV422 interleaved (raster or tiled), YUV444 single plane (raster only) or RGB888 (raster only)
 - Deinterlacing up to two 1080i video sources.
 - The single data path performs operations in the following order
 - Chroma Upsampling from 420 to 422 (if needed)
 - Deinterlacing of 422 video from interlaced to progressive (if needed)
 - Scaling of 422 video after deinterlace
 - Conversion of 422 video to 420, 444 or RGB (if needed)
 - VC-1 Range Mapping and Range Reduction support on input video before Chroma Upsampling (if needed)
- Chroma Upsampling Features
 - 4 line Catmull-Rom based implementation
 - Programmable coefficients for interlaced or progressive conversion. Separate coefficients can be provided for top and bottom fields
- Deinterlacer Features
 - 8-bit, YCbCr 4:2:2
 - Motion-adaptive deinterlacing (MDT)
 - Motion detection is based on Luma only
 - 4-field data is used
 - Motion values adaptive to the frequency of luma texture
 - Edge-Directed Interpolation (EDI)
 - Edge detection using luma pixels in a 2x7 window
 - Seven edge vectors: -1.5, -1, -0.5, 0, 0.5, 1, 1.5
 - Edge-directed chroma interpolation
 - Soft-switch between edge directed interpolation and vertical interpolation depending on the confidence factor
 - Film Mode Detection (FMD)
 - 3-2 pull down detection
 - 2-2 pull down detection
 - Hysteresis controls how fast FMD can enter/exit film mode (software function)
 - Bad Edit Detection (BED)
 - Progressive Input
 - For Progressive Input, the module passes input to output. No internal processing is performed. This is essentially a bypass mode
 - Interlace Bypass
 - For Interlace Input, the module can pass the inputs data directly to the outputs in a bypass configuration. No internal processing is performed
- Scaler Features
 - Vertical and horizontal up/down scaling
 - Polyphase filter upscaling

- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Minimum horizontal scaling ratio = 1/8x
- Maximum horizontal scaling ratio – limited by output line buffer (2014 pixels)
- Scaling filter Coefficient memory download
- Chroma Downsampler Features
 - Simple two-line averager capable of converting from YUV422 to YUV420 space
- 422 to 444 Features
 - Catmull-Rom based filter
 - 4 pixel, fixed coefficient
- Color Space Converter Features
 - Fully programmable 3x3 matrix multiplier with offset control

12.2 VPE Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests. [Figure 12-1](#) summarizes the integration of the module in the device.

Figure 12-1. VPE Integration

NOTE: Alternative clocking to the VPE module is provided from DPLL_VIDEO1. For more information about configuring DPLL_VIDEO1, see [Section 13.1.2.1, Display Subsystem Clocks](#). Source clock selection is done with CTRL_CORE_SMA_SW_1[8] VPE_CLK_DIV_BY_2_EN register from the Control Module. For more information, see [Chapter 20, Control Module](#).

Table 12-1 and Table 12-2 list the integration attributes and clock and resets, respectively.

Table 12-1. VPE Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
VPE	PD_VPE	L4_PER3 for configuration L3_MAIN for data (through VPDMA module)

Table 12-2. VPE Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VPE	L3_CLK PROC_CLK	VPE_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VPDMA uses this clock to send and receive external data and transfer this data to internal processing. PROC_CLK is the clock used to drive data processing within the VPE subsystem.
	L4_CLK PROC_D2_CLK	VPE_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus PROC_D2_CLK is an additional clock used by the DEI within the DEI Subsystem. Inputs and outputs of the DEI operate on PROC_CLK, but internally, the data paths within the DEI operate on this clock.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
VPE	VPE_RST	VPE_RST	PRCM	VPE Reset

Table 12-3. VPE Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
VPE	VPE_IRQ	IRQ_CROSSBAR_354	N/A	VPE interrupt requests. These IRQ source signals are not mapped by default to any device INTC.

NOTE: The “Default Mapping” column in [Table 12-3 VPE Hardware Requests](#) shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.
For more information about the IRQ_CROSSBAR module, see [Section 20.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 20, Control Module](#).
For more information about the device interrupt controllers, see [Chapter 19, Interrupt Controllers](#).

12.3 VPE Functional Description

12.3.1 VPE Block Diagram

[Figure 12-2](#) shows the internal structure of the VPE module in the device.

12.3.3 VPE Deinterlacer (DEI)

12.3.3.1 Functional Description

Figure 12-3 illustrates the block-diagram of motion-adaptive Deinterlacer. The general concept behind motion adaptive deinterlacing is that spatial filtering works very well for images with motion, while temporal filtering works very well for static images. So, the intuitive way is to combine them together. Motion detection is used to switch or fade between the use of spatial deinterlacing and temporal deinterlacing, as shown in the following formula:

$$\hat{y}(j, i, n) = \alpha y_{\text{spat}}(j, i, n) + (1 - \alpha) y_{\text{temp}}(j, i, n)$$

where $y_{\text{spat}}(j, i, n)$ is the spatial interpolation output, $y_{\text{temp}}(j, i, n)$ is temporal interpolation output, α is the motion detection output ranging from 0 to 1, $\hat{y}(j, i, n)$ is the final output from deinterlacer, and j, i, n are the vertical, horizontal, and temporal indexes, respectively. From the previous formula, the final output is controlled by the motion detector output, α . The higher the motion, the higher value of α , and the output favors spatial interpolation. If the motion is absent or very low, the temporal interpolation has higher weight.

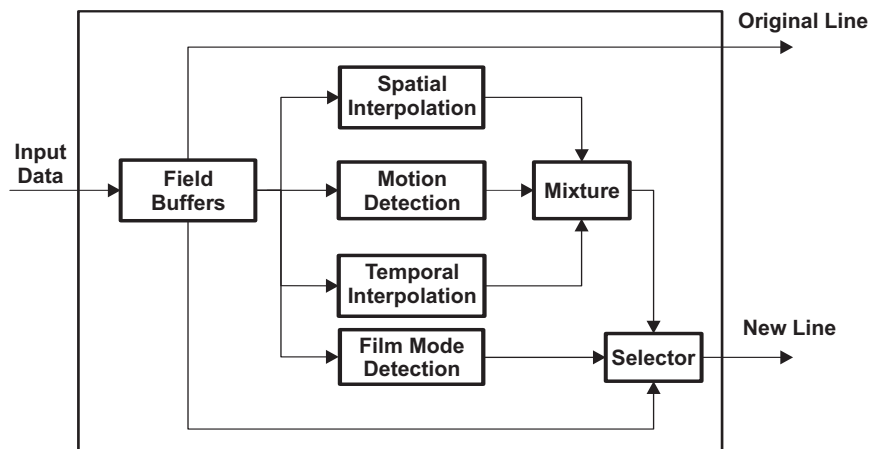

Temporal interpolation can be disabled by programmable control registers. In that case we have:

$$\hat{y}(j, i, n) = y_{\text{spat}}(j, i, n)$$

Chroma interpolation is handled in the same manner as luma with regards to the above equations. There is a separate control for disabling temporal interpolation for chroma, such that luma can perform the full mixture, and chroma can only be spatial. If luma temporal interpolation is disabled, chroma temporal interpolation is also disabled.

Figure 12-3 provides a simple description of how a motion-adaptive deinterlacer operates. The actual interpolation used is edge directed interpolation. Edge directed interpolation is only performed spatially prior to the output mixing.

Figure 12-3. Block Diagram of Motion-Adaptive Deinterlacer

The Deinterlacer consists of:

- MMR Configuration Register Block
 - - Used to program configuration items for the Deinterlacer
- VPDMA Interface Block
 - Used to read source video/motion data from VPDMA
 - Used to write generated motion data to VPDMA
- Motion Detection (MDT) Block
 - Examines 3 fields of input video data (luma only) and calculates a 4 bit motion vector to drive the Edge Directed Interpolation Block

- Edge Directed Interpolation (EDI) Block
 - Performs the motion based edge directed interpolation on Luma and Chroma inputs to generate the missing line in the interlaced source
- Film Mode Detection (FMD) Block
 - Field Difference : Accumulated difference between the spatial interpolated frame and the adjacent input field of opposite field ID
 - Frame Difference : Accumulated difference between two fields with the same field ID
 - Combing Artifacts : Accumulated sum-of-difference between two adjacent fields
- Output Multiplexor (MUX) Block
- Line Buffer Block

12.3.3.2 Bypass Mode

The DEI can be operated in bypass mode and deinterlacer mode.

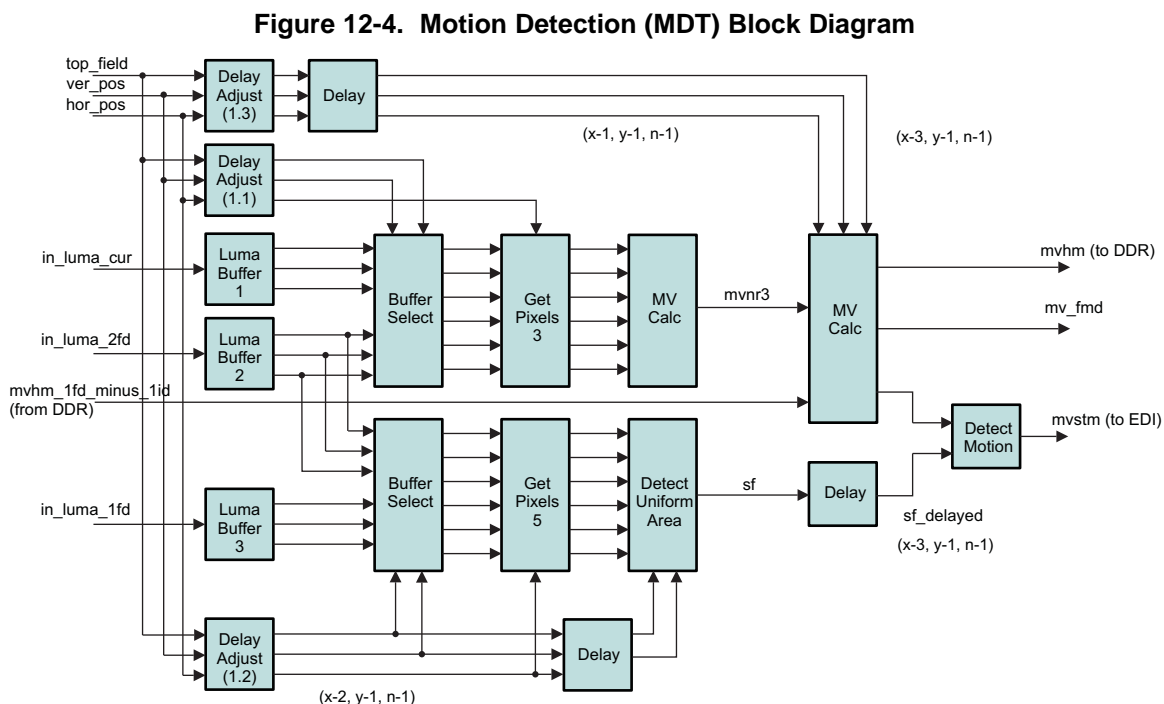

In the bypass mode, input luma and chroma are buffered and sent to the stage after DEI without processing. To bypass the DEI module registers `VPE_DEI_REGO[31]` PROGRESSIVE_BYPASS or `VPE_DEI_REGO[29]` INTERLACE_BYPASS must be set to '1' for progressive and interlaced source input respectively.

12.3.3.2.1 VPDMA Interface

The VPDMA interface handles transactions between the internal core of the design and the VPI interface protocol, which is used for both external module input and motion vector output. All input data is pixel aligned, but has different request and ready signals. Motion Output is not pixel aligned with input.

12.3.3.2.2 MDT

A block diagram representing the Motion Detection (MDT) Block is shown on [Figure 12-4](#).

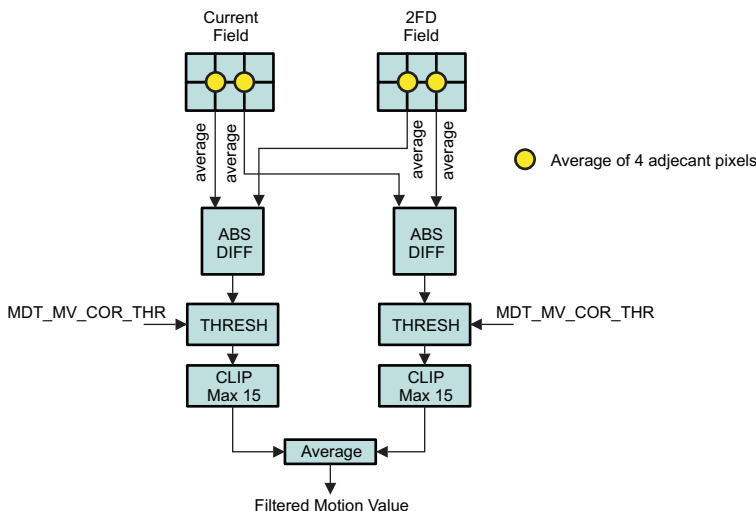

The Motion Detection block takes as input 3 adjacent fields of Luma data, motion data calculated from the previous 3 fields, and the current X, Y and field ID indicators and generates motion vector outputs which drive the Edge Directed Interpolation (EDI), Film Mode (FMD) and output motion values to DDR

There are two parallel paths - Motion Vector Calculation and Uniform Area Detection.

The Motion Vector Calculation path generates the FMD motion vector and the DDR output motion vector. The combination of the Motion Vector and Uniform Area Detection is used to calculate the EDI motion vector value.

The Motion Vector Calculation Path operates using a sliding 3 pixel wide by 2 pixel tall window over 2 adjacent fields of the same field ID polarity (2 top fields or 2 bottom fields). The first stage is to calculate the filtered motion value (MV Calc). The below diagram shows the dataflow for calculating the Filtered Motion Value from MV Calc:

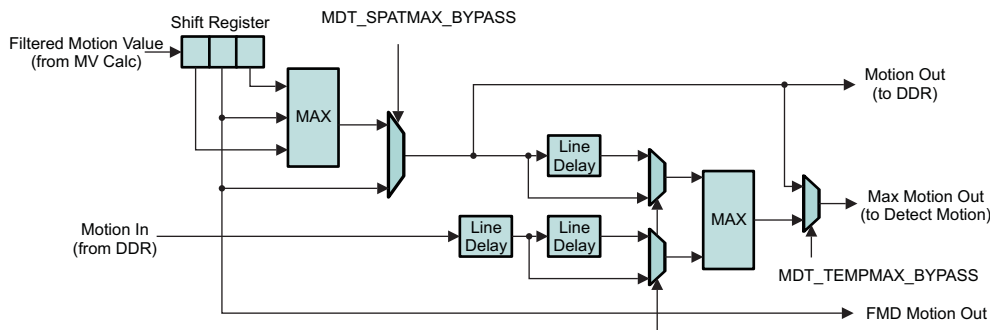

Figure 12-5. Motion Detection (MDT) MV Calc Data Path

The Filtered Motion Value is then operated on by the Max Filter operation, which performs a maximum operation between the last 3 filtered motion values and the last frame's motion value. The process is to calculate the maximum value of the last 3 filter motion values, and this value is written to DDR to be read back in on the next frame. The maximum value is taken between the previous frame's maximum value as read back from DDR, and the maximum value between the current last 3 motion values, and this is passed to the Detect Motion block which will drive the EDI module.

The Film Mode motion value output is just the output from the MV Calc data path. The following diagram shows the data path. Please note the line buffers, which are used to adjust for different polarity of fields (2 motion value fields are of opposite polarity, meaning a 1 line difference in one or the other field):

Figure 12-6. Motion Detection (MDT) Max Filter Data Path

vpe-004

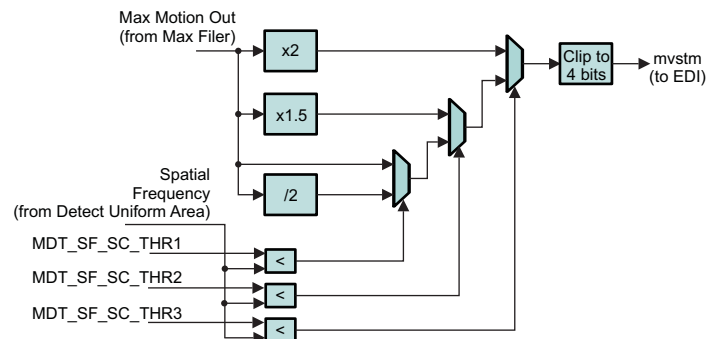

The Uniform Area Detection Path operates using a sliding 5 pixel wide by 3 pixel tall window over 2 adjacent fields of opposite field ID polarity (1 field delay and 2 field delay) to calculate a spatial frequency component. The following diagram shows how this component is calculated within each pixel window:

Figure 12-7. Motion Detection (MDT) Uniform Area Data Path

The spatial frequency output is used to scale the motion vector generated by the Maximum Filter operation based on thresholding against the MMR values [VPE_DEI_REG2\[7:0\] MDT_SF_SC_THR1](#), [VPE_DEI_REG2\[15:8\] MDT_SF_SC_THR2](#) and [VPE_DEI_REG2\[23:16\] MDT_SF_SC_THR3](#). The following diagram (in the Detect Motion block) performs this thresholding to generate the final motion vector output to the EDI module:

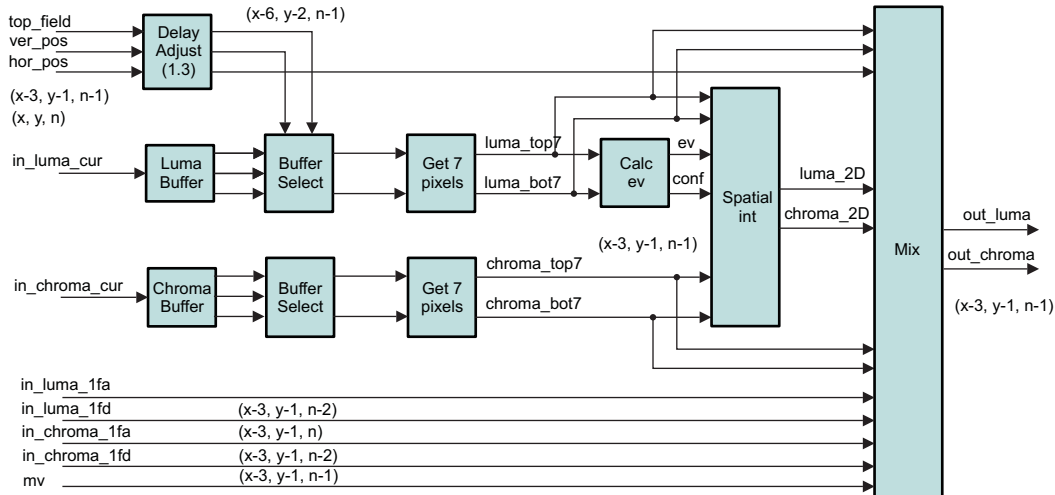

Figure 12-8. Motion Detection (MDT) Detect Motion Data Path

12.3.3.2.3 EDI

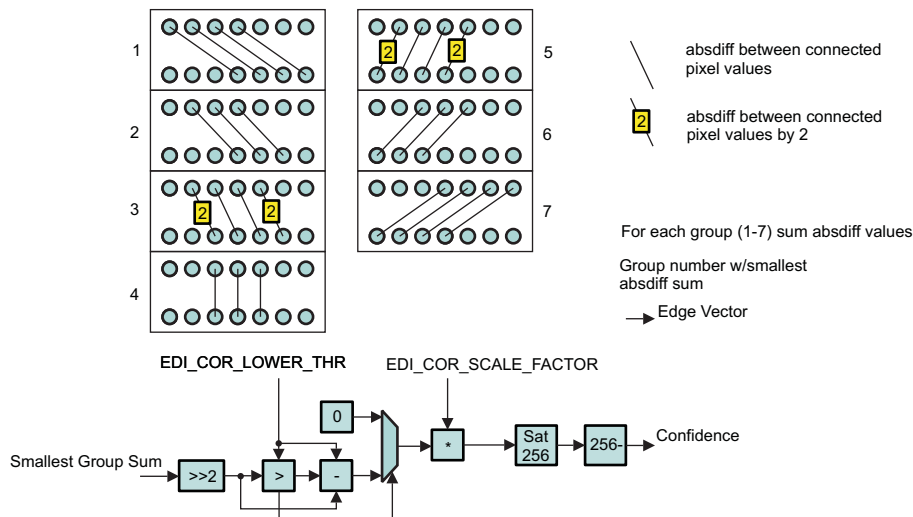

A block diagram representing the Edge Directed Interpolation (EDI) Block is shown on [Figure 12-9](#)

Figure 12-9. Edge Directed Interpolation (EDI) Block Diagram

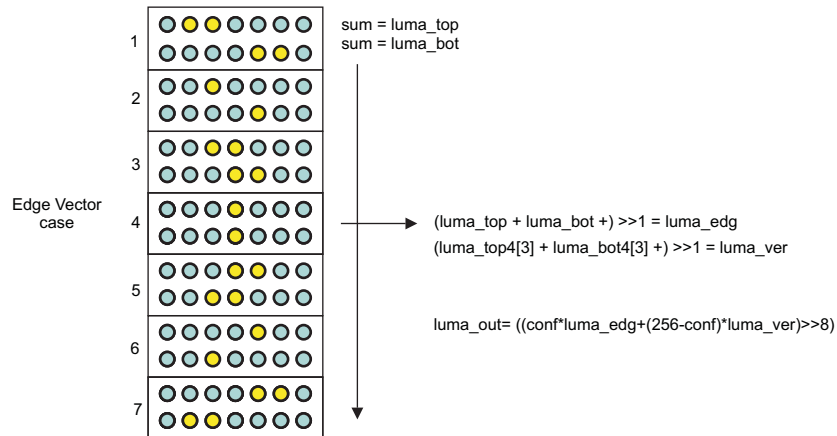

The Edge Directed Interpolation module operates on a 7x2 window (7 pixels wide, 2 in height) in both Luma and Chroma. Luma data is used to calculate an edge vector and edge vector confidence. Correlation scaling factor is set with `VPE_DEI_REG3[31:24] EDI_COR_SCALE_FACTOR` register. A diagram showing this calculation follows (Calc ev):

Figure 12-10. Edge Directed Interpolation Edge Vector Calculation

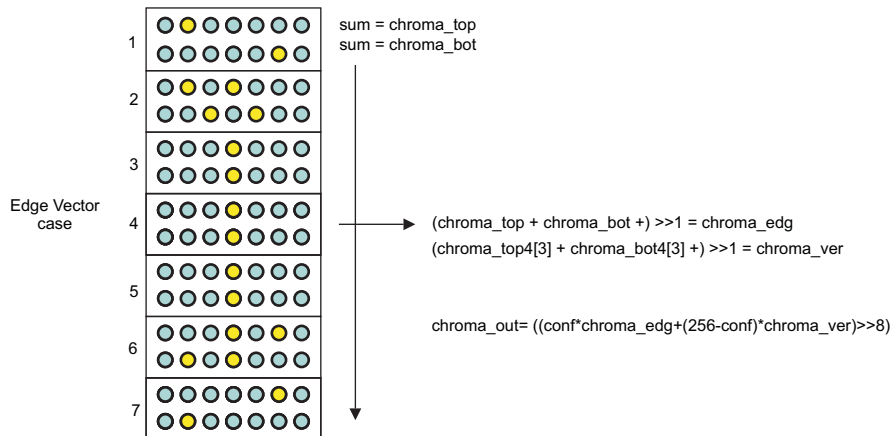

The edge vector and edge vector confidence are passed to the Spatial Interpolation module, which performs edge directed spatial interpolation. Following is a diagram showing how Luma is interpolated:

Figure 12-11. Edge Directed Interpolation Luma Interpolation Calculation

The following diagram shows how Chroma is interpolated:

Figure 12-12. Edge Directed Interpolation Chroma Interpolation Calculation

Each of the cases shown above is on the 7x2 input pixel window for Luma and Chroma, based on the edge vector that was calculated. Each output equation (luma_out and chroma_out) is a combination of a straight vertical interpolation (luma/chroma_ver) and edge directed interpolation (luma/chroma_edge) using the Confidence factor output from the Edge Vector Calculation module. In the case of chroma interpolation, if the register [VPE_DEI_REG3\[1:0\]](#) EDI_INP_MODE = "11", the chroma_out calculated for spatial interpolation is forced to the the vertical chroma output.

The Mix module does that actual mixing of spatial and temporal interpolation to produce the final result. 4 different interpolation modes are supported: Line double, Field double, 3D interpolation and 2D interpolation.

- Line double averages the top and bottom pixel to produce the interpolated pixel. Setting of MDT mode has no effect on output pictures.
- Field double averages the previous and next frame pixel to produce the interpolated pixel. In other words, if the current field is a top field, the interpolated bottom field picture is created by averaging pixels from bottom field pictures before and after the current field
- 2D interpolation uses the Edge Directed interpolation result only as the interpolated pixel
- 3D interpolation uses the EDI LUT table values with the MDT motion vector as an index to blend between the 2D result and the value from the previous field temporally.

NOTE: 3D processing is enabled with [VPE_DEI_REG3\[2\]](#) EDI_ENABLE_3D register

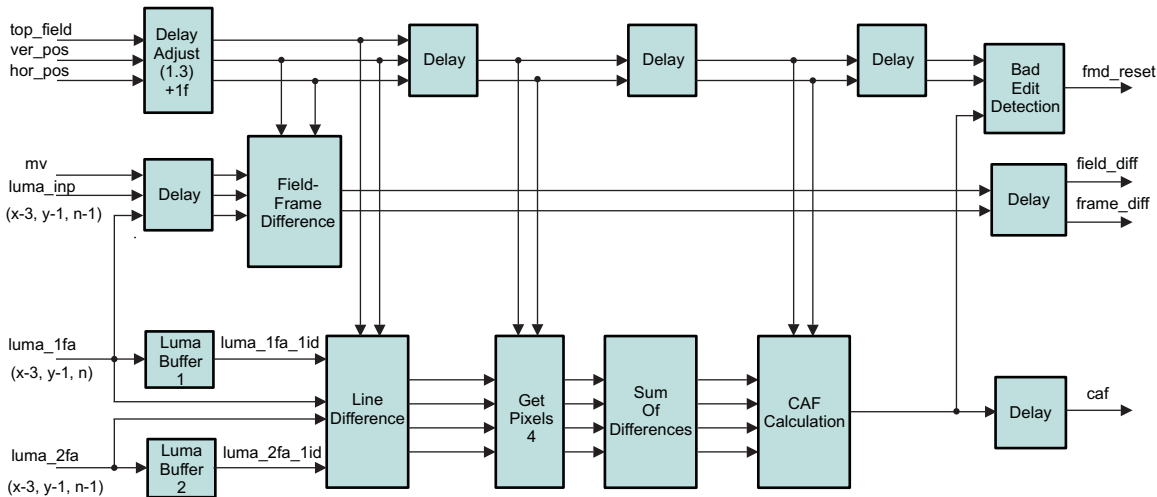

The EDI Lut value selected based on the motion value will perform a blend between temporal and edge directed spatial interpolation using the equation:

$$\hat{y}(j, i, n) = \alpha y_{\text{spat}}(j, i, n) + (1 - \alpha) y_{\text{temp}}(j, i, n)$$

12.3.3.2.4 FMD

The following shows the block diagram of the Film Mode Detection (FMD) module:

Figure 12-13. Film Mode Detection (FMD) Block Diagram

Film Mode Detection calculates four parameters which are used in conjunction with software to determine if the source of the video is film (3:2 or 2:2 sequences). This block is not part of the main data path, but calculates statistics based on the main data path for each frame generated, then interrupts the processor to read the information and then set to '1' the [VPE_DEI_REG10\[1\]](#) FMD_LOCK (lock to film mode) and [VPE_DEI_REG10\[2\]](#) FMD_JAM_DIR (direction of field jam) registers, to set the design to film mode operation.

All of the calculations are performed within a window defined by [VPE_DEI_REG8\[10:0\]](#) FMD_WINDOW_MINX, [VPE_DEI_REG8\[26:16\]](#) FMD_WINDOW_MAXX, [VPE_DEI_REG9\[10:0\]](#) FMD_WINDOW_MINY, [VPE_DEI_REG9\[26:16\]](#) FMD_WINDOW_MAXY. All calculations are reset on each new input frame.

Field difference is calculated as the absolute difference (absdiff) between the current Luma input and the previous field Luma input. Value can be read on [VPE_DEI_REG13\[27:0\]](#) FMD_FIELD_DIFF register. Frame difference is calculated using the motion input from the MDT. Value can be read on [VPE_DEI_REG14\[19:0\]](#) FMD_FRAME_DIFF register. [Figure 12-14](#) is showing how these are calculated is shown below:

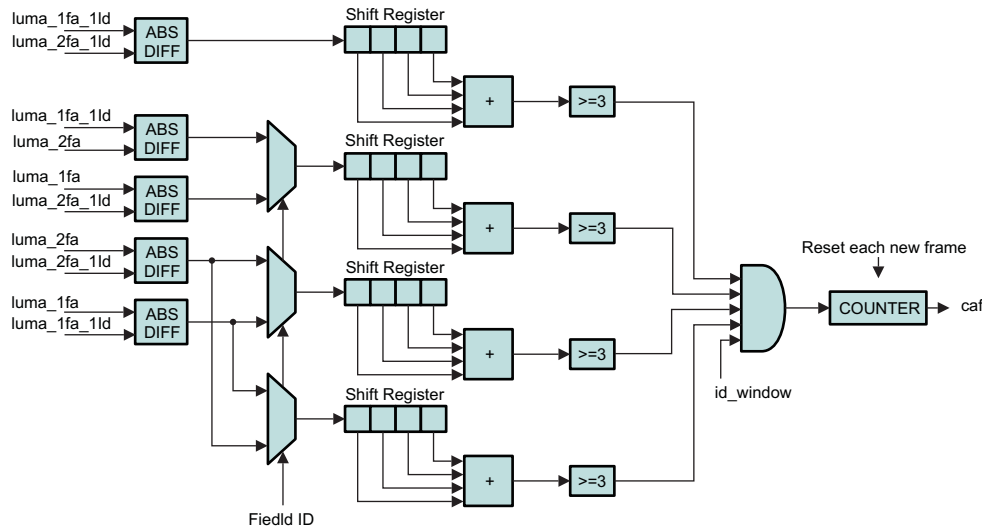

Figure 12-14. Film Mode Detection (FMD) Frame/Field Difference Calculation

NOTE: Value of FMD_WINDOW_MAXX must be less than WIDTH and value of FMD_WINDOW_MAXY must be less than 1/2 HEIGHT.

Combing Artifacts value is calculated as shown in Figure 12-15. Value can be read on VPE_DEI_REG12[20:0] FMD_CAF register.

Figure 12-15. Film Mode Detection (FMD) Combing Artifacts Calculation

FMD_RESET is set to tell software when the Film Mode Detection should be unlocked back to normal operation. The logic controlling this is based on the caf output, and is set based on caf being above a threshold set by VPE_DEI_REG11[19:0] FMD_CAF_THR and where within the window the current x/y position is. If the position is over 3/4 in height, and caf > FMD_CAF_THR OR if over 1/2 in height and caf > 3/4 * FMD_CAF_THR OR if over 1/4 in height and caf > 1/4 * FMD_CAF_THR, then VPE_DEI_REG12[24] FMD_RESET must be set (it will clear at the start of the next field input).

The Film Mode Interrupt (fmd_int) will be generated at the end of the window defined for FMD operation and tells software to read the above parameters. When the interrupt fires, the above parameters are latched into the DEI Control Interface (MMR) so they can be read.

12.3.3.2.5 MUX

The MUX block generates the proper outputs based whether the design is in standard Deinterlacer modes (interpolated inputs from the EDI), Film Mode Deinterlacer mode (direct inputs) or progressive bypass mode. The following diagram shows this data path:

Figure 12-16. Film Mode Detection (FMD) Combing Artifacts Data Path

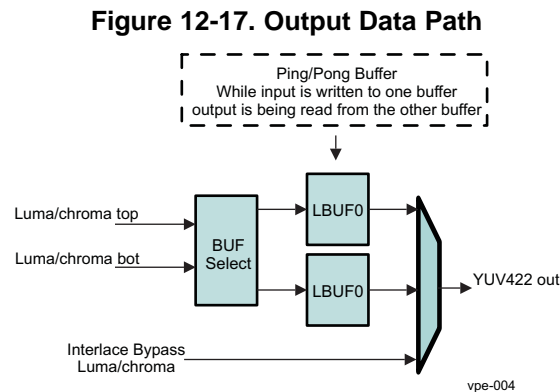

When in Film Mode (VPE_DEI_REG10[1] FMD_LOCK = '1'), the output of the DEI depends only on the input field sequences. Depending on the Jam Direction, either the previous or next field data is output. If not in Film Mode, the interpolated result from the EDI is output.

Because the DEI produces the missing line in an interlaced frame, what this part of the data path is selecting is the “interpolated” line. The other line output is the current line. Together, the interpolated line and the current line form the actual output of the main part of the DEI data path. Depending on if the current field is a top field or bottom field (as selected by Field ID), the output “top” of the MUX is either the current or interpolated lines, and the output “bot” is the opposite.

12.3.3.2.6 LINE BUFFER

The Line Buffer takes two lines of data (top line and bottom line) and serializes this into a single stream. The following diagram shows this data path:

The sequencing is such that LBUF0 is being written while LBUF1 is being read. When LBUF0 has been completely written, it will try to write to LBUF1 next. If on the output side LBUF1 has not been completely read, then the data path will stall waiting for the output to finish reading LBUF1 and switch to reading LBUF0 (and visa versa)

12.3.4 VPE Scaler (SC)

This section is used for driver development for the highly optimized video resizers, SC (scalers), in the VPE module.

12.3.4.1 SC Features

- Independent vertical and horizontal up and down scaling
- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Maximum horizontal scaling ratio only limited by output line buffer (2047 pixels)
- Scaling filter Coefficient memory download via VPI (Video Port Interface) Control interface

12.3.4.2 SC Functional Description

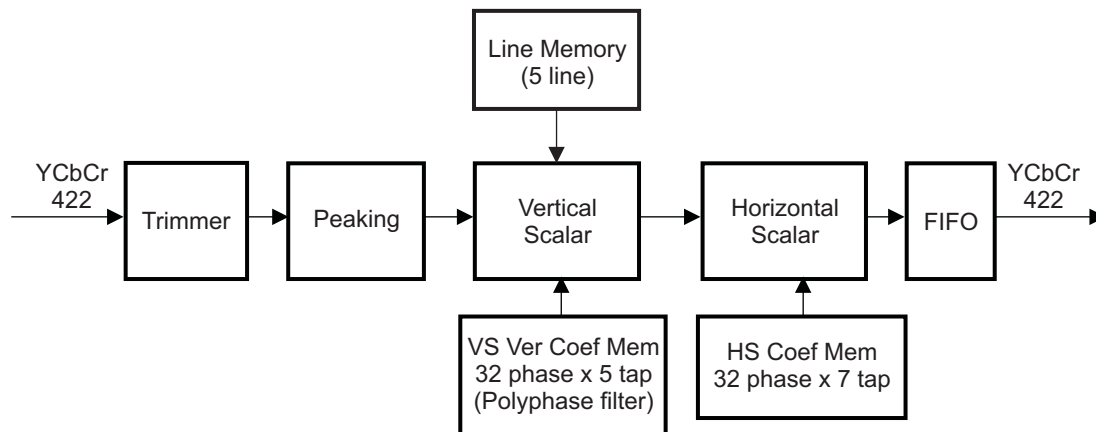

Scaler takes in a 10-bit YCbCr 422 video frame from an upstream module, performs vertical/horizontal scaling and outputs a YCbCr422 scaled image to a next downstream module. All configurations are done via the MMR interface except for the scaler coefficient memory configuration that is done via the common VPI control interface bus by VPDMA. [Figure 12-18](#) shows the high-level block diagram of the scaler module.

Figure 12-18. High Level Block Diagram

The SC is used in the video path and in all other video write-back data paths in the VPE module.

Scaling is performed in following three steps:

1. Trimming and Pre-peaking filtering
2. Vertical Scaling (Polyphase/Running Average Filter)
3. Horizontal polyphase scaling

Figure 12-19. SC Block Diagram

12.3.4.2.1 Trimmer

The trimmer can be programmed to re-define a new source image within the input video frame sent from an upstream module before it is sent to the scaling sub-modules. This feature enables small area zoom out, source pan/scan, or removal of unwanted area in the video (such as black box / curtains / noisy line-21 video) without modifying the VPDMA parameters.

Horizontal and vertical offset is set through [VPE_CFG_SC25\[26:16\] CFG_OFF_W](#) and [VPE_CFG_SC25\[10:0\] CFG_OFF_H](#) registers.

Width and height are set through [VPE_CFG_SC24\[26:16\] CFG_ORG_W](#) and [VPE_CFG_SC24\[10:0\] CFG_ORG_H](#) registers.

Figure 12-20. Input Image Trimming

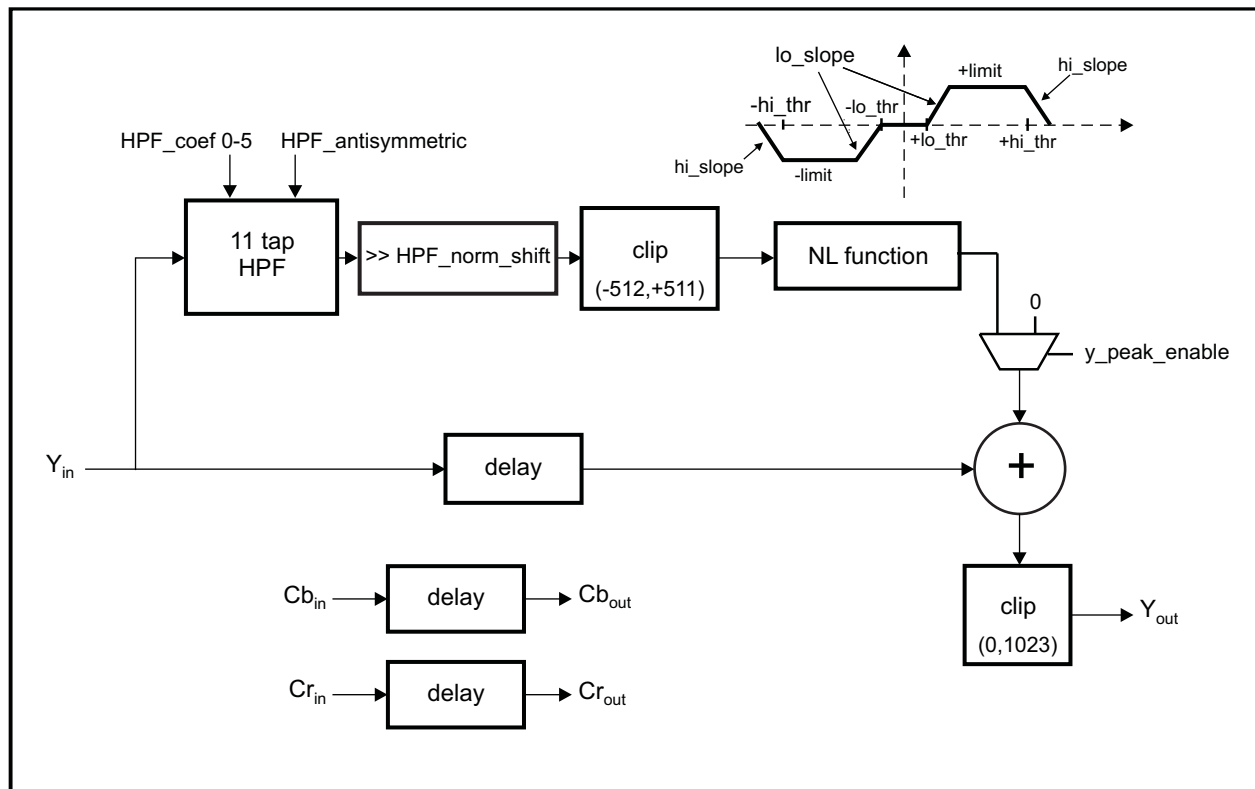

NOTE: Width and height of the source image are global parameters and are set with [VPE_CFG_SC5\[22:12\]](#) CFG_SRC_W and [VPE_CFG_SC5\[10:0\]](#) CFG_SRC_H registers.

It is required that the input image frame ($CFG_SRC_W \times CFG_SRC_H$) to be at least 32×32 (after trimming, if the trimming is enabled) to properly fill the input filter stage pipelines.

12.3.4.2.2 Peaking

The peaking block increases the amplitude of high frequency luminance information in horizontal direction to increase the sharpness of a video image before it is scaled. As shown in [Figure 12-21](#), the high-frequency luminance is increased using an 11-tap High-Pass filter with adjustable gain. The non-linear coring function removes low-level noise and the modified luminance is then added to the original luminance signal. The implementation details are shown in [Figure 12-21](#).

Figure 12-21. Filter Implementation and Parameter Description

vip-057

Table 12-4. Parameter Description

Parameter	Description	Bits	Default
VPE_CFG_SC19[7:0] CFG_HPF_COEF0 to VPE_CFG_SC20[15:8] CFG_HPF_COEF5	FIR coefficients	8	[0 0 0-4 0 8]
VPE_CFG_SC20[18:16] CFG_HPF_NORM_SHIFT	Right shift	3	4
VPE_CFG_SC21[8:0] CFG_NL_LO_THR	Coring threshold	9	16
VPE_CFG_SC22[8:0] CFG_NL_HI_THR	High threshold	9	400
VPE_CFG_SC21[23:16] CFG_NL_LO_SLOPE	Lo slope = - CFG_NL_LO_SLOPE/16	8	16
VPE_CFG_SC22[18:16] CFG_NL_HI_SLOPE_SHIFT	Hi slope = $2^{(CFG_NL_HI_SLOPE_SHIFT-3)}$	3	4
VPE_CFG_SC20[28:20] CFG_NL_LIMIT	Clipping limit	9	200
VPE_CFG_SC0[14] CFG_Y_PK_EN	Control	1	0

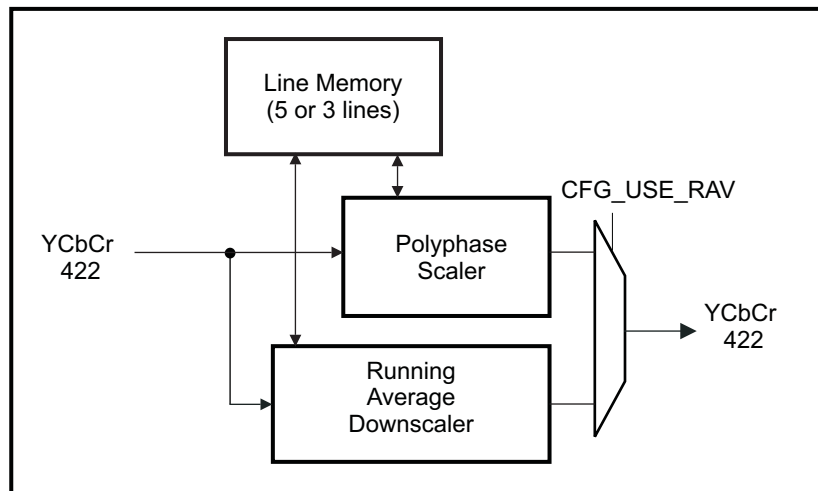

Parameters for the Peaking filters are defined in VPE_CFG_SC19 through VPE_CFG_SC22 registers. The frequency responses of the peaking-filter with different sets of coefficients are shown in Figure 12-22. If the source of the input video is NTSC or PAL format, the peaking filter can be configured to reject the color subcarrier frequency.

Figure 12-22. Peaking Filter at fs/4

12.3.4.2.3 Vertical Scaler

The vertical scaler has a polyphase (32-phase \times 5-tap) filter and a running average filter as shown in Figure 12-23. While the polyphase filter can be used for any up-scaling and preferably downscaling to 3/16 scale factor, the running average filter is used only for downscaling to a 1/2 or less size. Selection between these two scalers is based on the user setting of VPE_CFG_SC0[4] CFG_USE_RAV parameter (CFG_USE_RAV= '0' for polyphase filter, and CFG_USE_RAV= '1' for running average filter), according to the user preference of the tradeoff between sharpness preserving and introduced artifacts.

Figure 12-23. Vertical Scaler Block Diagram

12.3.4.2.3.1 Running Average Filter

When a poly-phase filter is used, usually it has to have many taps in order to achieve acceptable quality for very small downscaling ratio, which requires the use of many line buffers. In VPE, there is a weighted Running Average filter for downscaling when the scaling factor is small (for example, when the scaling ratio is less than 0.5). This highly optimized design requires only one line buffer for luma and one for chroma, which still achieving acceptable quality. The output of the running average filter is based on weighted average of pixels in the current and previous rows in vertical direction. Initializations of accumulators affect the weights.

12.3.4.2.3.2 Vertical Scaler Configuration Parameters

Table 12-5. Vertical Scaler Configuration Parameters

Parameter	Typical Value	Controls	Description
VPE_CFG_SC0[10] CFG_INTERLACE_I		Frame or Field	0 = progressive, 1 = interlace
VPE_CFG_SC0[0] CFG_INTERLACE_O			0 = progressive 1 = interlace
VPE_CFG_SC0[3] CFG_INV_T_FID			Invert field ID input
VPE_CFG_SC0[4] CFG_USE_RAV		Scaler Mode	0 = use polyphase scaler 1 = use running average scaler
VPE_CFG_SC1[26:0] CFG_ROW_ACC_INC		Bilinear & Polyphase Scalers	For progressive in/progressive out: $\text{round}(2^{16} \cdot (\text{srcH} - 1) / (\text{tarH} - 1))$ For progressive in/interlace out: $\text{round}(2^{16} \cdot 2 \cdot (\text{srcH} - 1) / (2 \cdot \text{tarH} - 1))$ For interlace in/progressive out: $\text{round}(2^{16} \cdot (2 \cdot \text{srcH} - 1) / (2 \cdot (\text{tarH} - 1)))$ For interlace in/interlace out: $\text{round}(2^{16} \cdot (2 \cdot \text{srcH} - 1) / (2 \cdot \text{tarH} - 1))$ For interlace in/out, srcH/tarH are number of field lines as specified in VPE_CFG_SC4/VPE_CFG_SC5 descriptions.
VPE_CFG_SC2[27:0] CFG_ROW_ACC_OFFSET	0		Initial row accumulator value for progressive frame and top field
VPE_CFG_SC3[27:0] CFG_ROW_ACC_OFFSET_B	0		Initial row accumulator value for bottom field
VPE_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR	4	Bilinear Scaler	Range for chroma soft switch based on pixel differences (max limit = 8)

Table 12-5. Vertical Scaler Configuration Parameters (continued)

Parameter	Typical Value	Controls	Description
VPE_CFG_SC13[21:12] CFG_CHROMA_INTP_THR	64		Threshold used in chroma soft switch based on pixel differences
VPE_CFG_SC13[9:0] CFG_SC_FACTOR_RAV		Running Average Scaler	Scale factor = round($1024 \times \text{tarH}/\text{srcH}$)
VPE_CFG_SC6[9:0] CFG_ROW_ACC_INIT_RAV			Initial row accumulator value for progressive frame and top field
VPE_CFG_SC6[19:10] CFG_ROW_ACC_INIT_RAV_B			Initial row accumulator value for bottom field

NOTE: Bi-linear scaler is not present in this device

12.3.4.2.4 Horizontal Scaler

The Horizontal scaler is implemented using a 32-phase \times 7-tap polyphase filter preceded by two sets of 1/2x decimators. The general configuration of the Horizontal scaler is performed as follows:

- For up scaling, the input video is interpolated using the polyphase scaler.
- For downscaling, it is recommended that input video is decimated by 2 until the modified scale factor falls between 1/2 and 1. Then, a polyphase filter is configured with coefficients selected based on the `mod_scale_factor` calculated as shown below from one of nine different sets of coefficients: (8,9,10,11,12,13,14,15,16)/16.

```

if (scale_factor >= 1/2) {
    mux=0; mod_scale_factor=scale_factor;
} else if (scale_factor >= 1/4) {
    mux=1; mod_scale_factor=2*scale_factor;
} else {
    mux=2; mod_scale_factor=4*scale_factor;
}

```

Figure 12-24. Horizontal Scaler Block Diagram

In auto mode (CFG_AUTO_HS = '1'), scaler will operate as per above recommendation. In addition to this, for (CFG_AUTO_HS = '1'), polyphase filtering will be bypassed when (scale_factor = '1') or (scale_factor = 1/2) or (scale_factor == 1/4). If CFG_AUTO_HS = '0' is used, user must provide proper values for dcm_2x, dcm_4x, proper values for all inputs to polyphase filter in the registers as well as appropriate coefficient sets. There is no constraint on polyphase filtering in terms of scaling ratio. However, there are constraints on input and output image width for scaler. Frame dimensions are limited from 64x64 to 2047x2047.

12.3.4.2.4.1 Half Decimation Filter

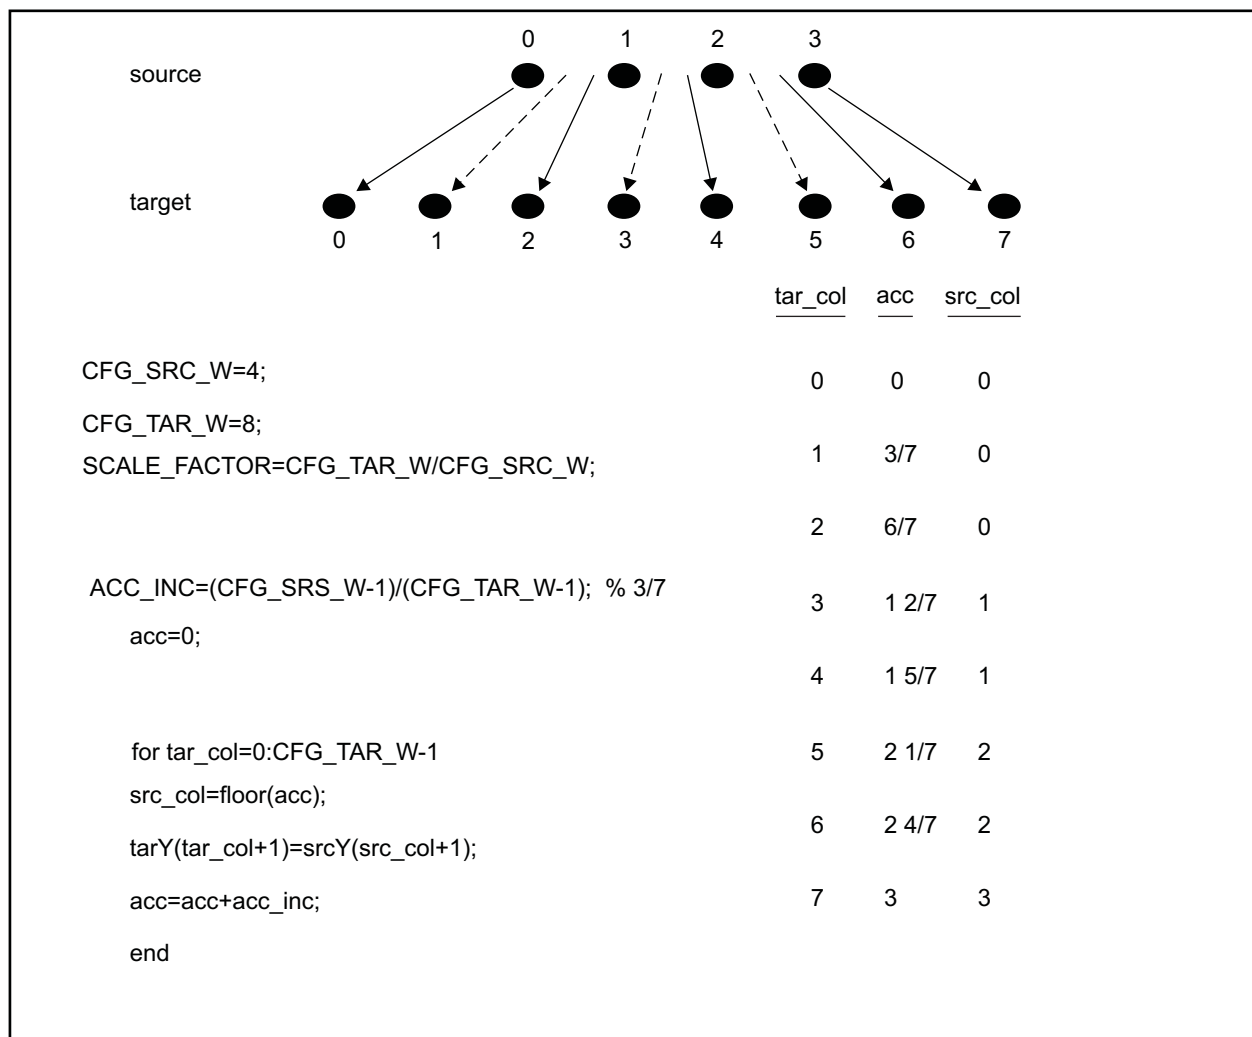

The half-decimation filter is an 11-tap filter with following coefficients: (14, 0, -29, 0, 79, 128, 79, 0, -29, 0, 14). For processing left and right edge pixels, the first and last data are repeated to pre-fill and extend the filter data pipeline respectively. These coefficients are hard-coded into scaler design and user cannot modify these.

12.3.4.2.4.2 Polyphase Filter

The horizontal scaling is done by stepping across the target row and interpolating target pixels based on source pixels. Accumulator points to the source pixel that corresponds to the target pixel.

Figure 12-25 shows an up-scaling example.

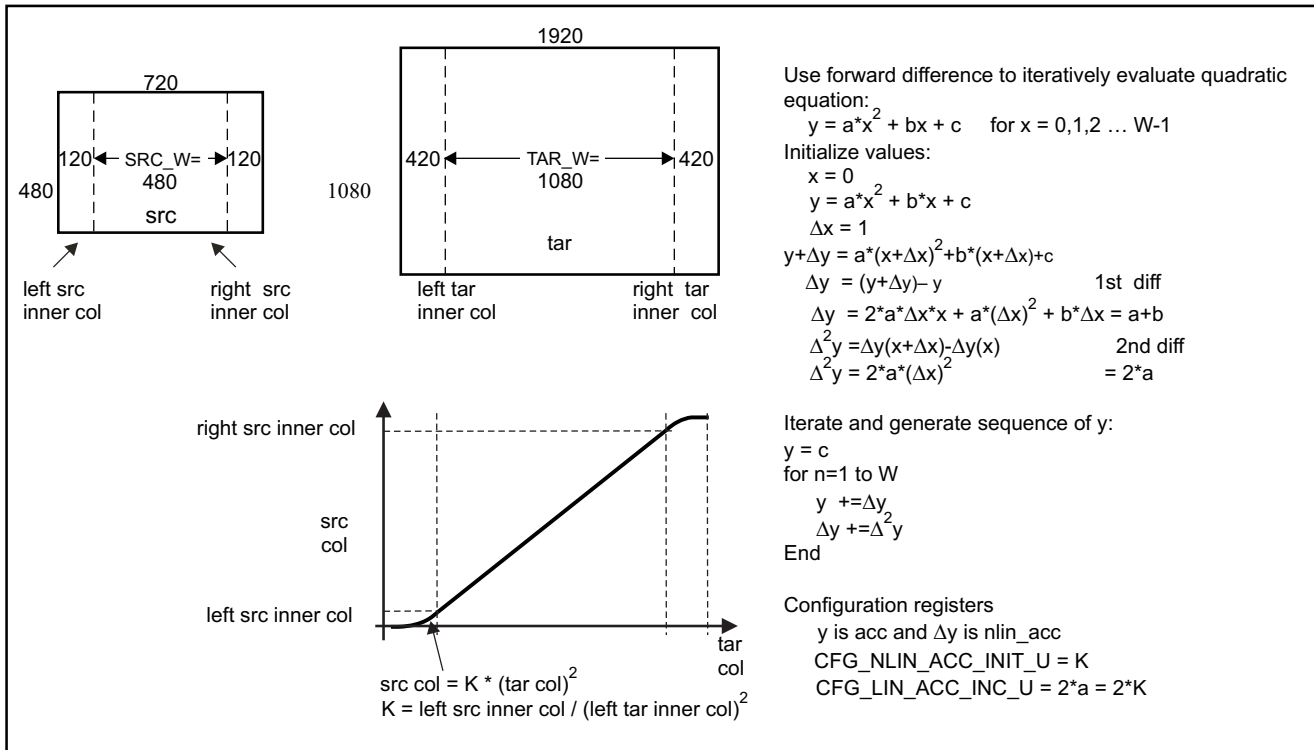

Figure 12-25. Polyphase Filtering Example

12.3.4.2.4.3 Nonlinear Horizontal Scaling

The horizontal scaler supports non-linear scaling to maintain the same aspect ratio for inner picture while stretching picture edges to fill the required resolution when capturing a 4 x 3 picture and fetching it as a 16 x 9 to memory. Non-linear scaling parameters are set with [VPE_CFG_SC4](#)[30:28] CFG_NLIN_ACC_INIT_U and [VPE_CFG_SC4](#)[26:24] CFG_LIN_ACC_INC_U registers. When setting up a non-linear scaling application, the inner picture is defined as the center square portion of the image with width and height equal to the height of the source image. Remaining side regions are then scaled non-linearly. [Figure 12-26](#) shows a non-linear scaling case.

Figure 12-26. Non-linear Scaling Example

12.3.4.2.4.4 Horizontal Scaler Configuration Registers

Table 12-6. Register Group 1

Parameter	Controls	Description			
VPE_CFG_SC4[10:0] CFG_TAR_H	Image Dimension	Source Width			
VPE_CFG_SC4[22:12] CFG_TAR_W		Target Width			
VPE_CFG_SC0[1] CFG_LINEAR	Scaler Mode	If (linear == 1) SRC_Wi = SRC_W and TAR_Wi = TAR_W Else SRC_W= SRC_H and TAR_W = TAR_H			
VPE_CFG_SC0[2] CFG_SC_BYPASS		0 = enable scaler, 1 = bypass scaler			
VPE_CFG_SC0[6] CFG_AUTO_HS		CFG_AUTO_HS	CFG_DCM_2X	CFG_DCM_4X	Definition
		0	0	0	Polyphase scaling
VPE_CFG_SC0[7] CFG_DCM_2X		0	0	1	Horizontal decimation by 4 and polyphase scaling
		0	1	0	Horizontal decimation by 2 and polyphase scaling
VPE_CFG_SC0[8] CFG_DCM_4X	1	-	-	Automatic (selection of decimation filter is automatic)	

Table 12-7. Register Group 2

Scale Factor	Decimation Usage	Control Register Bit
< 1/4	Decimation by 4	VPE_CFG_SC0[8] CFG_DCM_4X (set to 1 to enable decimation; disabled by default)
== 1/4	Decimation by 4	
1/4 < and < 1/2	Decimation by 2	VPE_CFG_SC0[7] CFG_DCM_2X (set to 1 to enable decimation; disabled by default)

12.3.4.2.6 Coefficient Memory

12.3.4.2.6.1 Overview

The scaler requires initialization of eight coefficient SRAMs prior to processing a video frame. These coefficients are stored in the external DDR memories and downloaded by the VPDMA. The VPDMA writes the coefficient data through the VPI Control Interface bus.

The eight coefficient SRAMs are:

- HS horizontal polyphase scaler, Luma and Chroma (7tap)
- VS vertical polyphase scaler, Luma and Chroma (5tap or 3tap)

12.3.4.2.6.2 Physical Coefficient SRAM Layout

Each of the six legacy coefficient SRAMs is 32 phases x 91 bits. A single coefficient value is 13 bits. Therefore, one word of the SRAM contains 7 coefficient values as shown in [Figure 12-27](#), and 224 coefficient values are stored in each SRAM.

Figure 12-27. SRAM Layout for 7tap Coefficient

Phase 0	C6	C5	C4	C3	C2	C1	C0
Phase 31	C223	C222	C221	C220	C219	C218	C217

The two vertical polyphase SRAMs are 32 phases x 65 bits. A single coefficient is 13 bits. Therefore, one word of SRAM contains 5 coefficient values as shown in [Figure 12-28](#).

Figure 12-28. SRAM Layout for 5tap Coefficient

Phase 0	C4	C3	C2	C1	C0
Phase 31	C221	C220	C219	C218	C217

12.3.4.2.6.3 Scaler Coefficients Packing on 128-bit VPI Control I/F

A coefficient value is 13 bits wide and takes a single half word. Thus, one VPI Control write carries one phase's worth of coefficients. The last half-word in a quad-word is not used for 7tap coefficients.

Figure 12-29. VPI Control I/F Coef Data Format (7tap)

The Vertical Polyphase scaler coefficients have only five or three values per phase, so the last three (or five) entries are unused. The Vertical Polyphase coefficient packing is shown in [Figure 12-30](#) and [Figure 12-31](#).

Figure 12-30. VPI Control I/F Coef Data Format (5tap)

Figure 12-31. VPI Control I/F Coef Data Format (3tap)

12.3.4.2.6.4 VPI Control I/F Memory Map for Scaler Coefficients

The memory map of the VPI Control I/F for the Scaler coefficients is shown in [Figure 12-32](#). All coefficients can be filled up by a single VPI Control write command. The update address feature of VPI Control I/F enables individual access to a certain location of memories.

Figure 12-32. VPI Control I/F Memory Map (Write)

sc_m

vip-070

The module supports the VPI Control Read to read back the contents in the coefficient memories for debug purpose. [Figure 12-33](#) shows the memory map of the VPI Control Read. As the VPI Control Read has only 32 bit data bus, it requires the word addressing while the write does the quad-word addressing.

Figure 12-33. VPI Control I/F Memory Map (Read)

12.3.4.2.6.5 VPI Control Interface

VPDMA is used to configure the coefficient memories of scaler through VPI control interface. Since the coefficient memories are not shadowed (unlike the memory mapped registers), VPI control write access needs to be done only during the gap between video frame processing times. If a write request is made while the Scaler is active, the access will be held off by the hardware until the last data of the currently processed frame is sent out. Care must be given to the order of the DMA descriptors so that blocking of VPI control bus does not occur.

12.3.4.2.6.6 Coefficient Table Selection Guide

The scaler filter coefficient tables are pre-generated using a MATLAB® program for various scaling factor ranges. Table 12-11 provides a general selection guide table for coefficient data files.

The mentioned .dat files are available in Section 12.3.4.4.

Table 12-11. Coefficient Data Files

Scaler	Scale Factor	Coeff table
HS Polyphase Filter	All upscaling	Section 12.3.4.4.1.1, ppfcoef_scael_eq_1_32_phases_flip.dat
	½ or ¼ down scaling	Section 12.3.4.4.1.1, ppfcoef_scale_eq_1_32_phases_flip.dat
	> 15/16	Section 12.3.4.4.1.9, ppfcoef_scale_eq_15div16_32_phases_flip.dat
	> 14/16	Section 12.3.4.4.1.8, ppfcoef_scale_eq_14div16_32_phases_flip.dat
	> 13/16	Section 12.3.4.4.1.7, ppfcoef_scale_eq_13div16_32_phases_flip.dat
	> 12/16	Section 12.3.4.4.1.6, ppfcoef_scale_eq_12div16_32_phases_flip.dat
	> 11/16	Section 12.3.4.4.1.5, ppfcoef_scale_eq_11div16_32_phases_flip.dat
	> 10/16	Section 12.3.4.4.1.4, ppfcoef_scale_eq_10div16_32_phases_flip.dat
	> 9/16	Section 12.3.4.4.1.3, ppfcoef_scale_eq_9div16_32_phases_flip.dat
> 8/16	Section 12.3.4.4.1.2, ppfcoef_scale_eq_8div16_32_phases_flip.dat⁽¹⁾	

(1) HS Scaler has two sets of ½ decimator to perform downscaling ratios below ½ and ¼.

Table 12-11. Coefficient Data Files (continued)

Scaler	Scale Factor	Coeff table

12.3.4.3.3 Typical Configuration Values

The following is the list of all scaler register fields that are set to constant values, representing typical settings:

- [VPE_CFG_SC0\[3\]](#) CFG_INV_T_FID = 0 (Field ID will be used without inversion)
- [VPE_CFG_SC0\[5\]](#) CFG_ENABLE_EV = 1 (Field ID will be used without inversion)
- [VPE_CFG_SC0\[6\]](#) CFG_AUTO_HS = 1 (The hardware will automatically decide, if current operation is up or down scaling. In down-scaling, it will also decide, if 2X or 4X decimation filter is needed)
- [VPE_CFG_SC0\[7\]](#) CFG_DCM_2X = 0 (The 2X decimation filter is disabled)
- [VPE_CFG_SC0\[8\]](#) CFG_DCM_4X = 0 (The 4X decimation filter is disabled)
- [VPE_CFG_SC0\[11\]](#) CFG_ENABLE_SIN2_VER_INTP = 1 (Modified bilinear interpolation is used)
- [VPE_CFG_SC0\[14\]](#) CFG_Y_PK_EN = 0 (Luma peaking is disabled)
- [VPE_CFG_SC0\[15\]](#) CFG_TRIM= 1 (Trimming is enabled)
- [VPE_CFG_SC12\[24:0\]](#) CFG_COL_ACC_OFFSET = 0 (No horizontal offset is involved)
- [VPE_CFG_SC13\[21:12\]](#) CFG_CHROMA_INTP_THR = 64 (If the difference is less than this threshold, the interpolation of chroma should be done along edge direction. Otherwise, the interpolation of chroma should be done vertically)
- [VPE_CFG_SC13\[27:24\]](#) CFG_DELTA_CHROMA_THR = 4 (max limit=8)

VPE_CFG_SC18[24:16] CFG_CONF_DEFAULT = 0x100 (Defines confidence factor when edge detection is disabled (**VPE_CFG_SC0**[5] CFG_ENABLE_EV bit = 0))

VPE_CFG_SC19 = 0xFC000000

VPE_CFG_SC20 = 0x0C840800

VPE_CFG_SC21 = 0x00100010

VPE_CFG_SC22 = 0x00040190

12.3.5 VPE Color Space Converter (CSC)

The color space converter (CSC) module is used to convert video data from one color space to another with nine programmable integer multipliers.

12.3.5.1 CSC Features

- All parameters are programmable
- Each parameter is configurable in signed 13-bits
- Support for Bypass Mode

12.3.5.2 CSC Functional Description

The conversion between the different color spaces requires addition and multiplication operations on color and intensity components. The mathematical expression of the conversion can be written as:

$$\begin{aligned} Y &= A0 * R + B0 * G + C0 * B + D0 \\ Cb &= A1 * R + B1 * G + C1 * B + D1 \\ Cr &= A2 * R + B2 * G + C2 * B + D2 \end{aligned}$$

Color space coefficients are set through the following registers:

- For luma component:
 - VPE_CSC00[12:0] A0
 - VPE_CSC00[28:16] B0
 - VPE_CSC01[28:16] C0
 - VPE_CSC04[27:16] D0
- For Cb component:
 - VPE_CSC01[28:16] A1
 - VPE_CSC02[12:0] B1
 - VPE_CSC02[27:16] C1
 - VPE_CSC05[11:0] D1
- For Cr component :
 - VPE_CSC03[12:0] A2
 - VPE_CSC03[27:16] B2
 - VPE_CSC04[12:0] C2
 - VPE_CSC05[27:16] D2

Using YUV to RGB conversion as an example: YUV represents one color space and RGB represents another color space. The conversion can be written in the matrix format shown in [Figure 12-34](#).

Figure 12-34. Matrix Format

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} A0 & B0 & C0 \\ A1 & B1 & C1 \\ A2 & B2 & C2 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} D0 \\ D1 \\ D2 \end{bmatrix}$$

Since HDTV and SDTV have different conversion requirements, both conversions of RGB-to-YCbCr and YCbCr-to-RGB are described. The details of derivations of these matrixes will be given in the following subsections.

12.3.5.2.1 HDTV Application

12.3.5.2.1.1 HDTV Application with Video Data Range

The two equations presented in this section are for the HDTV application. The chromaticity parameters are defined by ITU-R709 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 12-35. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.2126 & 0.7152 & 0.0722 \\ -0.1172 & -0.3942 & 0.5114 \\ 0.5114 & -0.4646 & -0.0468 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 12-36. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.5396 \\ 1 & -0.1831 & -0.4577 \\ 1 & 1.8142 & 0 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -197 \\ 82 \\ -232 \end{bmatrix} D$$

12.3.5.2.1.2 HDTV Application with Graphics Data Range

The two equations presented in this section are for the HDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R709 standard.

The input data ranges for these equations are as follows.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 12-37. Conversion from RGB to YCbCr

$$\begin{bmatrix} Y_d \\ C_b \\ C_r \end{bmatrix} = \begin{bmatrix} 0.1826 & 0.6142 & 0.0620 \\ -0.1006 & -0.3385 & 0.4392 \\ 0.4392 & -0.3990 & -0.0402 \end{bmatrix} \begin{bmatrix} R_d \\ G_d \\ B_d \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 12-38. Conversion from YCbCr to RGB

$$\begin{bmatrix} R_d \\ G_d \\ B_d \end{bmatrix} = \begin{bmatrix} 1.1644 & -0.0003 & 1.7927 \\ 1.1644 & -0.2132 & -0.5329 \\ 1.1642 & 2.1125 & -0.0001 \end{bmatrix} \begin{bmatrix} Y_d \\ C_b \\ C_r \end{bmatrix} + \begin{bmatrix} -248 \\ 77 \\ -289 \end{bmatrix} D$$

12.3.5.2.1.3 Quantized Coefficients for Color Space Converter in HDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for HDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

Table 12-12. Quantized Coefficients of HDTV Application with Video Data Range

12.3.5.2.2 SDTV Application

12.3.5.2.2.1 SDTV Application with Video Data Range

The two equations presented in this section are for the SDTV application. The chromaticity parameters are defined by ITU-R601 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 12-39. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.172 & -0.339 & 0.511 \\ 0.511 & -0.428 & -0.083 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

$$\begin{bmatrix} R_d \\ G_d \\ B_d \end{bmatrix} = \begin{bmatrix} 1 & -0.0003 & 1.3717 \\ 1 & -0.3365 & -0.6984 \\ 1 & 1.7336 & -0.0016 \end{bmatrix} \begin{bmatrix} Y_d \\ C_b \\ C_r \end{bmatrix} + \begin{bmatrix} -176 \\ 132 \\ -222 \end{bmatrix} D$$

12.3.5.2.2.2 SDTV Application with Graphics Data Range

The two equations presented in this section are for the SDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R601 standard.

The input data ranges for these equations are as following.

In an 8-bit system:

- R_d , G_d , B_d , Y_d , C_b and C_r will be the range [0-255]
- $D = 1$

In a 10-bit system:

- R_d , G_d , B_d , Y_d , C_b and C_r will be in the range [0-1023]
- $D = 4$

Conversion from RGB to YCbCr:

Figure 12-41. Conversion from RGB to YCbCr

$$\begin{bmatrix} Y_d \\ C_b \\ C_r \end{bmatrix} = \begin{bmatrix} 0.257 & 0.504 & 0.098 \\ -0.148 & -0.291 & 0.439 \\ 0.439 & -0.368 & -0.071 \end{bmatrix} \begin{bmatrix} R_d \\ G_d \\ B_d \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

12.3.5.3 CSC Bypass Mode

CSC module can be bypassed by setting `VPE_CSC05[28]` BYPASS bit-field to 1.

12.3.6 VPE Chroma Up-Sampler (CHR_US)

The chroma up-sampler (CHR_US) module is used to convert from YCbCr 4:2:0 data format input to YCbCr 4:2:2 format output.

12.3.6.1 Features

- Supports both interlaced and progressive inputs
- 4-tap interpolation filtering
- Filter coefficients are all programmable
- Four sets of coefficients (each set has four coefficients) corresponding to anchor pixels and interpolated pixels of top field and bottom field
- For progressive inputs, the coefficients corresponding to top and bottom field must be identical
- Each coefficient is 14 bit (4.10 format)
- Default filter coefficients are based on Catmull-Rom algorithm
- Capable of removing the half pel vertical offset so all chroma samples are on-grid. This step ensures that the output does not suffer from any kind of rainbow effect due to chroma-upsampling.
- Provides a 10-bit interface in both directions: 10-bit input and 10-bit output
- Support bypass mode for 4:2:2 input

12.3.6.2 Functional Description

The YUV420 input to Chroma Upsampler module must be in the format shown in [Figure 12-43](#), in which the chroma sample lies in the left column of a 2x2 pixel block with half pel vertical shift.

Figure 12-43. 4:2:0 YCrCb Color Space with Chroma Left-aligned

The upsampling is performed by an interpolation filter which uses Catmull-Rom algorithm. The Catmull-Rom Filter is based on four anchor pixels representing a four tap filter. The general 4-tap filter Catmull-Rom filter is defined in [Figure 12-44](#).

Figure 12-44. 4:2:0 YCrCb Color Space with Chroma Left-aligned

$$[1 \ x \ x^2 \ x^3] * \begin{bmatrix} 0 & 1 & 0 & 0 \\ -a & 0 & a & 0 \\ 2a & -3+a & 3-2a & -a \\ -a & 2-a & -(2-a) & a \end{bmatrix}$$

In the previous figure, x is the distance to the interpolated point between the two anchor points. In Figure 12-45, the example shows the desired interpolated point to be 1/4 of the distance between Anchor0 and Anchor1. Thus, x = 1/4.

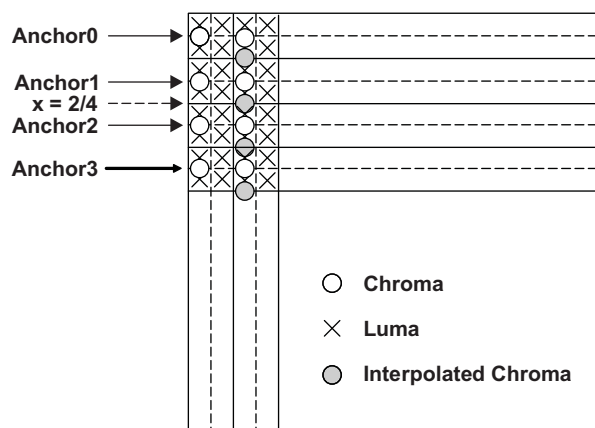

Figure 12-45. 4:2:0 YCrCb Color Space with Chroma Left-aligned

The variable 'a' determines the characteristics of the filter. a = 1/2 is generally used because the filter will produce an interpolated output that is an exact match to a linear input curve. In the literature, some people have noted that a=0.75 or a=1.0 may be more pleasing to the eye. In the implementation, the filter coefficients are programmable through MMR.

For the interpolated pixel, the variable x defines the positional offset relative to anchor pixel1. Figure 12-46 shows four anchor pixels with Anchor0 being near the top of the image and Anchor3 near the bottom. x is relative to Anchor1. Positive values of x goes down towards Anchor3. Negative x values imply a direction towards Anchor0. For example, if we want to interpolate a pixel midway between Anchor1 and Anchor2, x would be 2/4=1/2. There are four half pels between Anchor1 and Anchor2. Midway is two pels, so x=2/4.

Figure 12-46. Anchor Pixels

In the implementation, we need to interpolate the anchor pixel to get it on-grid. Then, we also need to interpolate a completely new pixel for YPrPb 4:2:2.

For a progressive input, x = -1/4 for getting the anchor pixel on-grid. x = 1/4 for generating the new pixel.

Lines are scanned from the top of the picture to the bottom.

12.3.6.3 For Interlaced YUV420 Input Data

Figure 12-47 shows how 4:2:0 video is split into top and bottom fields in interlaced format. Chroma is attached to alternating Luma lines in the top and bottom fields such that color is equally spread out between the top field and the bottom field. This 4:2:0 interlaced chroma representation is shown in the following figure.

In each interlaced field, the chroma anchor points are separated by 4 pixel lines, or 8 half pels. The 4:2:2 chroma interpolated color space representation of interlaced pictures is shown in Figure 12-48.

Figure 12-48. Ideal 4:2:2 Chroma Upsampling for Interlaced Scan

Following interpolation, the chroma samples lie on a 4:2:2 grid.

Anchor pixels for the top field have been sited up by half a pel ($x = -1/8$). The new interpolated pixel is sited 3 half pels ($x=3/8$) down. Samples from the top field are distinct from samples in the bottom field.

For the bottom field, anchor pixels are sited 3 half pels up ($x = -3/8$). The new interpolated pixel is sited 1 half pel down ($x=1/8$).

The chroma upsampling filter accepts different coefficients for the top field and the bottom field. In the case of progressive input, the coefficients for the top field and bottom field must be the same.

It should be noted that a different implementation could have been chosen to use the same coefficients for the top and bottom fields. Instead of pushing pixels from the top to bottom of a picture, it can be shown that pushing the bottom field through the upsampling filter from the bottom to the top of the picture permits using the same values for x as in the top field case.

12.3.6.4 Edge Effects

Several methods with increasing levels of difficulty resulting in increasing quality can be employed to deal with chroma pixels near the edges. In this module, the edge pixels can be mathematically approximated using the same filter as the rest of the picture. Edge pixels are duplicated going into the filter.

12.3.6.5 Modes of Operation (VPDMA)

In both primary (PRI) and auxiliary (AUX) paths, the mode in which the VPDMA needs to be operated depends whether the chroma upsampler and de-interlacers are enabled or not. Table 1-12 shows the modes of operation.

Table 12-16. VPDMA Modes of Operation

Mode A	Mode B
Input data is 4:2:0	Input data is 4:2:2

These modes need to be set in the following register bit-fields of particular instances being used:

[VPE_REG0\[17:16\] CFG_MODE](#)

LINE_MODE bitfield in VPDMA registers of format RD_LB_CLIENT_CTL_STATUS need to be configured as follows:

Mode A corresponds to MMR value 0

Mode B corresponds to MMR value 1

The following are the VPDMA client related bit-fields that need to be configured:

[VPE_PRI_CHROMA_CSTAT\[9:8\] LINE_MODE](#)

[VPE_PRI_FLD1_CHROMA_CSTAT\[9:8\] LINE_MODE](#)

[VPE_PRI_FLD2_CHROMA_CSTAT\[9:8\] LINE_MODE](#)

-
- NOTE:**
1. For VPDMA luma clients, Mode B should always be used.
 2. For VPDMA chroma clients, Mode A is used for 420 data and Mode B is used for 422 data.
-

12.3.6.6 Coefficient Configuration

The filter coefficients are left-aligned 14-bit binary values in signed Q4.10 format. The decimal point is between bits 9 and 10 using the convention of the least significant bit being at position zero. The most significant bit, 13, is the sign bit.

In the register map, the most significant nibble of the coefficient is the sign and the integer portion of the value. The next 10 bits represent the fractional portion of the coefficient value.

Chroma upsampling requires two sets of coefficients. Each coefficient set is comprised of four 14-bit Q4.10 values. One set is used for the top field of an interlaced picture, and the other set is used for the bottom field of an interlaced picture. For a progressive picture, both sets must be identical.

The coefficients and settings should be used for the following video source types:

4:2:2 input (progressive or interlaced input)

VPDMA line mode = 1

[VPE_REG0\[17:16\] CFG_MODE](#) = 0x1 (mode B)

CHR_US coefficients are not used in this mode, so values are "don't care"

4:2:0 input (interlaced input):

VPDMA line mode = 0

VPE_REG0[17:16] CFG_MODE = 0x0 (mode A)

VPE_REG0[31:18] ANCHOR_FID0_C0 = 0x51

VPE_REG0[15:2] ANCHOR_FID0_C1 = 0x3d5

VPE_REG1[31:18] ANCHOR_FID0_C2 = 0x3fe3

VPE_REG1[15:2] ANCHOR_FID0_C3 = 0x3ff7

VPE_REG2[31:18] INTERP_FID0_C0 = 0x3fb5

VPE_REG2[15:2] INTERP_FID0_C1 = 0x2e9

VPE_REG3[31:18] INTERP_FID0_C2 = 0x18f

VPE_REG3[15:2] INTERP_FID0_C3 = 0x3fd3

VPE_REG4[31:18] ANCHOR_FID1_C0 = 0x16b

VPE_REG4[15:2] ANCHOR_FID1_C1 = 0x247

VPE_REG5[31:18] ANCHOR_FID1_C2 = 0xb1

VPE_REG5[15:2] ANCHOR_FID1_C3 = 0x3f9d

VPE_REG6[31:18] INTERP_FID1_C0 = 0x3fcf

VPE_REG6[15:2] INTERP_FID1_C1 = 0x3db

VPE_REG7[31:18] INTERP_FID1_C2 = 0x5d

VPE_REG7[15:2] INTERP_FID1_C3 = 0x3ff9

4:2:0 input (progressive input):

VPDMA line mode = 0

VPE_REG0[17:16] CFG_MODE = 0x0 (mode A)

VPE_REG0[31:18] ANCHOR_FID0_C0 = 0x00C8

VPE_REG0[15:2] ANCHOR_FID0_C1 = 0x0348

VPE_REG1[31:18] ANCHOR_FID0_C2 = 0x0018

VPE_REG1[15:2] ANCHOR_FID0_C3 = 0x3fd8

VPE_REG2[31:18] INTERP_FID0_C0 = 0x3fb8

VPE_REG2[15:2] INTERP_FID0_C1 = 0x0378

VPE_REG3[31:18] INTERP_FID0_C2 = 0x00e8

VPE_REG3[15:2] INTERP_FID0_C3 = 0x3fe8

VPE_REG4 to VPE_REG7 are not used so their values are "don't care".

12.3.7 VPE Chroma Down-Sampler (CHR_DS)

When the picture input is 4:2:2, the chroma must be downsampled to 4:2:0 before it is stored into DRAM for later compression by the imaging subsystem. The downsampling is performed by an averaging filter.

An array with chroma samples must be used- $C_{IN}[i]$ with range from 0 to N-1. ($C_{IN}[0]$ is the topmost chroma sample and $C_{IN}[N-1]$ is bottom chroma sample) .

The output array C_{OUT} (ranging from 0 to N/2 - 1) is calculated by the following formula:

$$C_{OUT}[i] = CLIP[(C_{IN}[2i] + C_{IN}[2i+1]) / 2]CLIP[x] \quad (x = 0 \text{ to } 255).$$

This filter performs simple averaging of two input lines into one output line.

12.3.8 VPE YUV422 to YUV444 Conversion

As shown on [Figure 12-2](#), prior the CSC the video format needs to be converted from YUV422 to YUV444 format. This conversion only applies to the Chroma samples in the color space, and is implemented using a 4-tap Catmull-Rom algorithm using the following equations:

$$C_{OUT}[2*i] = C_{IN}[i] \quad C_{OUT}[2*i+1] = \text{CLIP} (9/16*C_{IN}[i] + 9/16*C_{IN}[i+1] - 1/16*C_{IN}[i-1] - 1/16*C_{IN}[i+2] + 1)$$

NOTE: Edge effects are treated by repeating the first and last pixel per line.

12.3.9 VPE Video Port Direct Memory Access (VPDMA)

12.3.9.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

12.3.9.2 VPDMA Basic Definitions

12.3.9.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VPE) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

12.3.9.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports four types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.
- **Free Channel** - Used in video compositions. The Free channel data type is always ignored as it uses the same data type of the descriptor that first calls the free channel.

12.3.9.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports two types of lists: a Regular List and a Self-Modifying List.

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the [VPE_LIST_ADDR](#) register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the LIST_ATTR register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to [VPE_LIST_ADDR](#) register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the list_attr.rdy bit after the firmware loading is complete.

12.3.9.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more information see [Section 12.3.9.8, VPDMA Data Formats](#).

- RGB Data Types:
 - RGB16-565
 - ARGB-1555
 - ARGB-4444
 - RGBA-5551
 - RGBA-4444
 - ARGB24-6666
 - RGB24-888
 - ARGB32-8888
 - RGBA24-6666
 - RGBA32-8888
- YUV Data Types:
 - Y 4:4:4
 - Y 4:2:2
 - Y 4:2:0
 - C 4:4:4
 - C 4:2:2
 - C 4:2:0
 - CY 4:2:2
 - YCbC 4:4:4
 - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

12.3.9.3 VPDMA Client Buffering and Functionality

Table 12-17 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 12-17. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features
dei_hq_1_chroma	hq_vid1_chroma	1920 (color separate) 960 (interleaved)	1920 (color separate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_1_luma	hq_vid1_luma	1920 (color separate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_2_luma	hq_vid2_luma	1920 (color separate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_2_chroma	hq_vid2_chroma	1920 (color separate) 960 (interleaved)	1920 (color separate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_3_luma	hq_3_luma	1920 (color separate) 960 (interleaved)	4096	Virtual Video Buffer TILED
dei_hq_3_chroma	hq_3_chroma	1920 (color separate) 960 (interleaved)	1920 (color separate) 960 (interleaved)	Virtual Video Buffer with line buffer limitations TILED
dei_hq_mv_in	hq_mv_in	Tiled Data Not Supported	4096	
dei_hq_mv_out	hq_mv_out	Tiled Data Not Supported	4096	
vip1_up_y	vip1_porta_luma vip1_porta_rgb	1920 (color separate) 960 (interleaved)	4096	TILED
vip1_up_uv	vip1_porta_chroma	1920 (color separate) 960 (interleaved)	4096	TILED

12.3.9.4 VPDMA Channels Assignment

Table 12-18 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer descriptor. The Client field states the name of the Client and in parentheses it states the reference number in Figure 12-2, VPE Block Diagram.

Table 12-18. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
hq_vid1_luma	High Quality DEI Video 420 Luma Data/ 422 Interleaved Data	0	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_1_luma (7)
hq_vid1_chroma	High Quality DEI Video 420 Chroma Data	1	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_1_chroma (7)
hq_vid2_luma	Low Cost DEI Field Minus 1420 Luma Data	2	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_2_luma (8)
hq_vid2_chroma	Low Cost DEI Field Minus 1 420 Chroma Data	3	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_2_chroma (8)

Table 12-18. VPDMA Channels Assignment (continued)

Channel	Description	Channel Number	Data Type	Client
hq_vid3_luma	Low Cost DEI Field Minus 2 420 Luma Data	4	YUV (0x1,0x2,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_3_luma (9)
hq_vid3_chroma	Low Cost DEI Field Minus 2 420 Chroma Data	5	YUV (0x5,0x6,0x7 If data type 0x7 is used half the data fetched will be thrown out.)	dei_hq_3_chroma (9)
hq_mv	Low Cost DEI Motion Vector	12	OTHER (4)	dei_hq_mv_in (6)
hq_mv_out	Low Cost DEI Motion Vector Write	15	OTHER (4)	dei_hq_mv_out (6)
vip1_porta_luma	Video Input 1 Port A 420 Data Luma	102	YUV (0x1, 0x2,0x7)	vip1_up_y (1)
vip1_porta_chroma	Video Input 1 Port A 420 Data Chroma	103	YUV (0x5,0x6,0x7)	vip1_up_uv (1)
vip1_porta_rgb	Video Input 1 Port A RGB Data	106	RGB (0x0-0x8)	vip1_up_y (1)

12.3.9.5 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each separate interrupt group. A status register bit exists for each interrupt source for for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

Table 12-19 shows all interrupt events from the VPDMA that go to VPE top level. The interrupt events are mapped to one interrupt line, INT0, that go to VPE top level.

Table 12-19. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VPE_INT0_CHANNEL0_INT_STAT	VPE_INT0_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 has fired.
vpdma_int_channel_group1	VPE_INT0_CHANNEL1_INT_STAT	VPE_INT0_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 has fired.
vpdma_int_channel_group2	VPE_INT0_CHANNEL2_INT_STAT	VPE_INT0_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 has fired.
vpdma_int_channel_group3	VPE_INT0_CHANNEL3_INT_STAT	VPE_INT0_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 has fired.
vpdma_int_channel_group4	VPE_INT0_CHANNEL4_INT_STAT	VPE_INT0_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 has fired.

Table 12-19. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description		
vpdma_int_channel_group5	VPE_INT0_CHANNEL5_INT_STAT	VPE_INT0_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 has fired.		
vpdma_int_list0_complete vpdma_int_list0_notify	VPE_INT0_LIST0_INT_STAT	VPE_INT0_LIST0_INT_MASK	List 0 has completed The data transfer in list 0 with the Notify Field set in the descriptor has completed		
vpdma_int_list1_complete vpdma_int_list1_notify			List 1 has completed The data transfer in list 1 with the Notify Field set in the descriptor has completed		
vpdma_int_list2_complete vpdma_int_list2_notify			List 2 has completed The data transfer in list 2 with the Notify Field set in the descriptor has completed		
vpdma_int_list3_complete vpdma_int_list3_notify			List 3 has completed The data transfer in list 3 with the Notify Field set in the descriptor has completed		
vpdma_int_list4_complete vpdma_int_list4_notify			List 4 has completed The data transfer in list 4 with the Notify Field set in the descriptor has completed		
vpdma_int_list5_complete vpdma_int_list5_notify			List 5 has completed The data transfer in list 5 with the Notify Field set in the descriptor has completed		
vpdma_int_list6_complete vpdma_int_list6_notify			List 6 has completed The data transfer in list 6 with the Notify Field set in the descriptor has completed		
vpdma_int_list7_complete vpdma_int_list7_notify			List 7 has completed The data transfer in list 7 with the Notify Field set in the descriptor has completed		
vpdma_int_client			VPE_INT0_CLIENT0_INT_STAT VPE_INT0_CLIENT1_INT_STAT	VPE_INT0_CLIENT0_INT_MASK VPE_INT0_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor			VPE_INT0_LIST0_INT_STAT	VPE_INT0_LIST0_INT_STAT	Descriptor Interrupt

In [Table 12-19](#) above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group,” “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to [Table 12-20](#) to determine what the actual interrupt was).

Table 12-20. VPE Interrupt Sources

Interrupt	Interrupt Group	Description
channel_hq_mv	channel_group0	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager.
channel_hq_mv_out	channel_group0	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager.
channel_hq_vid1_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid1_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid2_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid2_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid3_chroma	channel_group0	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_hq_vid3_luma	channel_group0	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.

Table 12-20. VPE Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
client_dei_hq_1_chroma	client	The client interface dei_hq_1_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_1_luma	client	The client interface dei_hq_1_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_2_chroma	client	The client interface dei_hq_2_chroma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_2_luma	client	The client interface dei_hq_2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_3_chroma	client	The client interface dei_hq_2_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_3_luma	client	The client interface dei_hq_3_luma has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_mv_in	client	The client interface dei_hq_mv_in has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
client_dei_hq_mv_out	client	The client interface dei_hq_mv_out has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_uv	client	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_y	client	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vpi_ctl	client	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
control_descriptor_int0	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0.
control_descriptor_int1	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1.
control_descriptor_int10	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10.
control_descriptor_int11	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11.

Table 12-20. VPE Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
control_descriptor_int12	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12.
control_descriptor_int13	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13.
control_descriptor_int14	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14.
control_descriptor_int15	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15.
control_descriptor_int2	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2.
control_descriptor_int3	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3.
control_descriptor_int4	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4.
control_descriptor_int5	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5.
control_descriptor_int6	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6.
control_descriptor_int7	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7.
control_descriptor_int8	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8.
control_descriptor_int9	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9.
list0_complete	list0_complete	List 0 has completed and a new list can be loaded.
list0_notify	list0_notify	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel.
list1_complete	list1_complete	List 1 has completed and a new list can be loaded.
list1_notify	list1_notify	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel.
list2_complete	list2_complete	List 2 has completed and a new list can be loaded.
list2_notify	list2_notify	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel.
list3_complete	list3_complete	List 3 has completed and a new list can be loaded.
list3_notify	list3_notify	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel.
list4_complete	list4_complete	List 4 has completed and a new list can be loaded.
list4_notify	list4_notify	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel.
list5_complete	list5_complete	List 5 has completed and a new list can be loaded.
list5_notify	list5_notify	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel.
list6_complete	list6_complete	List 6 has completed and a new list can be loaded.
list6_notify	list6_notify	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel.
list7_complete	list7_complete	List 7 has completed and a new list can be loaded.
list7_notify	list7_notify	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel.
other		Any channel that is not assigned to a specific client has completed.

12.3.9.6 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

- i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.
- ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller
- iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

12.3.9.6.1 Data Transfer Descriptors

In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 12-49. Inbound Data Transfer Descriptor Format

	31:24			23:16				15:8			7:0	
Word 0	Data Type	Notify	Field	1D	Even Line Skip	RSV	Odd Line Skip	Line Stride				
Word 1	Line Length						Transfer Height					
Word 2	Start Address								RSV	RSV		
Word 3	Packet	Mode	Dr	Channel			Reserved	Pri	Next Channel			
Word 4	Frame Width						Frame Height					
Word 5	Horizontal Start						Vertical Start					
Word 6	Client Specific Attributes											
Word 7	Client Specific Attributes											

vpe-072

Figure 12-50. Outbound Data Transfer Descriptor Format

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word 0	Data Type						Notify	Field	1D	Reserved	Even Line Skip	Reserved	Odd Line Skip	Line Stride																		
Word 1	Reserved																															
Word 2	Start Address																															
Word 3	Packet Type				Mode	Dir	Channel						NoReject	Reserved	Pri	Next Channel																
Word 4	Descriptor Write Address																								Reserved	write descriptor	Drop Data	Descriptor Reg				
Word 5	Reserved																								Max Width	Reserved	Max Height					
Word 6	Client Specific Attributes																															
Word 7	Client Specific Attributes																															

The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8×32 bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

12.3.9.6.1.1 Data Packet Descriptor Word 0 (Data)
Table 12-21. Data Packet Descriptor Word 0 Field Descriptions

Bit	Field	Value	Description
31:26	Data Type		Miscellaneous Channel Sets the pixel size in bits plus 1
			RGB Channel
		0	RGB16-565
		1h	ARGB-1555
		2h	ARGB-4444
		3h	RGBA-5551

		37h	YCb 4:2:2
25	Notify	0-1	Send List Notification Interrupt upon last transfer of this channel
24	Field	0-1	Field Value
23	1D	0-1	The transfer is one dimensional. The transfer and frame sizes are combined to make a single 32 bit transfer size. For writes this value is passed to the generated descriptor. This feature is not supported by all clients. Only clients that support the feature will recognize this bit.

Table 12-21. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
15:0	Line Stride	0-FFFFh	Address stride between lines in bytes

12.3.9.6.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in [Table 12-22](#) and [Table 12-23](#);
- For a BGRA data type, the B component would be in the LSB location;

Table 12-22. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 12-23. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in [Table 12-24](#) and [Table 12-25](#). The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 12-24. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 12-25. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

[Table 12-26](#) shows the proper settings required for RGB data types for both storage schemes.

Table 12-26. VPDMA Descriptor RGB Data Type Mapping

Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	Column A Data stored in the VPDMA defined order	Column B Data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In [Table 12-26](#), if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

Table 12-27 shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 12-27. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UYV	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYYV (YUV422I_UYYV)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see ⁽¹⁾)
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see ⁽¹⁾)	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see ⁽¹⁾)

⁽¹⁾ If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to [Section 12.3.9.8, VPDMA Data Formats](#).

12.3.9.6.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

12.3.9.6.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

12.3.9.6.1.1.4 1D

This bit is set if a large one dimensional frame needs to be send to the client. In this case the stride is ignored and for the write the stride the generated descriptor will always be 0. If this bit is set then the transfer length and transfer height and frame width and frame height fields are combined to form one 32 bit field with the upper 8 bits reserved and the lower 24 bits being the size of the frame in pixels.

12.3.9.6.1.1.5 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

12.3.9.6.1.1.6 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

12.3.9.6.1.1.7 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

12.3.9.6.1.2 Data Packet Descriptor Word 1

Table 12-28. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

12.3.9.6.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

12.3.9.6.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

12.3.9.6.1.3 Data Packet Descriptor Word 2

Table 12-29. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0] If Mode is TILED, then TILER specific ADDRESS Map is used: Bits 31-29: 0 0-degree view 1h 180-degree view + mirroring 2h 0-degree view + mirroring 3h 180-degree view 4h 270-degree view + mirroring 5h 270-degree view 6h 90-degree view 7h 90-degree view + mirroring Bits 28-27: 0 8-bit container 1h 16-bit container 2h 32-bit container 3h Page Mode If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

12.3.9.6.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

12.3.9.6.1.4 Data Packet Descriptor Word 3

Table 12-30. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 12.3.9.6.1.4.5, Priority , for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

12.3.9.6.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

12.3.9.6.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

12.3.9.6.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers form an internal buffer to an external location (outbound).

12.3.9.6.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

12.3.9.6.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

12.3.9.6.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

12.3.9.6.1.5 Data Packet Descriptor Word 4

12.3.9.6.1.5.1 Inbound data

Table 12-31. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

12.3.9.6.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

12.3.9.6.1.5.1.2 **Frame Height**

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

12.3.9.6.1.5.2 **Outbound data**

Table 12-32. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

12.3.9.6.1.5.2.1 **Descriptor Write Address**

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

12.3.9.6.1.5.2.2 **Write Descriptor**

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

12.3.9.6.1.5.2.3 **Drop Data**

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit, no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written. If it is desired that all the descriptors are written in order to a set queue then this bit should be set and the CURRENT_DESCRIPTOR, DESCRIPTOR_TOP and DESCRIPTOR_BOTTOM registers are used to define the location of the descriptor queue that will be written.

12.3.9.6.1.5.2.4 Use Descriptor Register

Bit 0 determines where the descriptor should be written. If it is desired that all the descriptors are written in order to a set queue then this bit should be set and the CURRENT_DESCRIPTOR, DESCRIPTOR_TOP and DESCRIPTOR_BOTTOM registers are used to define the location of the descriptor queue that will be written.

12.3.9.6.1.6 Data Packet Descriptor Word 5

12.3.9.6.1.6.1 Outbound data

Table 12-33. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	The maximum allowable pixels per line. 0: Unlimited Line Size 1: Use VPE_MAX_SIZE1 Max Width field 2: Use VPE_MAX_SIZE2 Max Width field 3: Use VPE_MAX_SIZE3 Max Width field 4: 352 pixels 5: 768 pixels 6: 1280 pixels 7: 1920 pixels Others: Reserved
2:0	Max Height	The maximum allowable lines per frame. 0: Unlimited Frame Size 1: Use VPE_MAX_SIZE1 Max Height field 2: Use VPE_MAX_SIZE2 Max Height field 3: Use VPE_MAX_SIZE3 Max Height field 4: 288 lines 5: 576 lines 6: 720 lines 7: 1080 lines Others: Reserved

NOTE: Width and Height are set in the following register bit-fields:

- For [VPE_MAX_SIZE1](#): [VPE_MAX_SIZE1](#)[31:16] MAX_WIDTH and [VPE_MAX_SIZE1](#)[15:0] MAX_HEIGHT
- For [VPE_MAX_SIZE2](#): [VPE_MAX_SIZE2](#)[31:16] MAX_WIDTH and [VPE_MAX_SIZE2](#)[15:0] MAX_HEIGHT registers
- For [VPE_MAX_SIZE3](#): [VPE_MAX_SIZE3](#)[31:16] MAX_WIDTH and [VPE_MAX_SIZE3](#)[15:0] MAX_HEIGHT

12.3.9.6.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger then 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

12.3.9.6.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

12.3.9.6.1.7 Data Packet Descriptor Word 6/7 (Data)

The words 4/5 give a 64 bit of configuration that can be passed specifically to the module that supports it. This is passed directly down to the module through a VPI Control port. Please see the section on the specific clients for the format of this data.

12.3.9.6.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 × 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

12.3.9.6.2.1 Configuration Descriptor Header Word0

Table 12-34. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

12.3.9.6.2.2 Configuration Descriptor Header Word1

Table 12-35. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

12.3.9.6.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

12.3.9.6.2.3 Configuration Descriptor Header Word2

Table 12-36. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

12.3.9.6.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

12.3.9.6.2.4 Configuration Descriptor Header Word3

Table 12-37. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

12.3.9.6.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

12.3.9.6.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

12.3.9.6.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger than the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

12.3.9.6.2.4.3.1 Address Data Block Format

Table 12-38. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

12.3.9.6.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 12-39. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
4	VPE Scaler	VPE Scaler Coefficient Tables

12.3.9.6.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

12.3.9.6.3 Control Descriptor

12.3.9.6.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

12.3.9.6.3.2 Control Descriptor Header Description

Table 12-40. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

12.3.9.6.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

12.3.9.6.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

12.3.9.6.3.2.3 Control

The Control field defines the specific function of the descriptor. [Table 12-41](#) lists the different control descriptors.

12.3.9.6.3.3 Control Descriptor Types

Table 12-41. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the VPE_LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

12.3.9.6.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 12-42. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 12-43. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 12-43. Sync on Client Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

12.3.9.6.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 12-44. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

12.3.9.6.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the [VPE_LIST_STAT_SYNC](#) register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the [VPE_LIST_STAT_SYNC](#) bit for the list number that called the descriptor.

Table 12-45. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

12.3.9.6.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 12-46. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 12-46. Sync on Channel Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

12.3.9.6.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

12.3.9.6.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 12-47. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 12-48. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 12-49. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

12.3.9.6.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information of VPDMA interrupt events, see [Section 12.3.9.5, VPDMA Interrupts](#).

Table 12-50. Send Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

12.3.9.6.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 12-51. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 12-52. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Table 12-53. Reload List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

12.3.9.6.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 12-54. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

12.3.9.7 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

12.3.9.7.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the [VPE_LIST_ADDR\[31:0\]](#) [VPE_LIST_ADDR](#) register and then writes the LIST_ATTR register. If the NUMBER in the [VPE_LIST_ATTR\[26:24\]](#) LIST_NUM is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the [VPE_LIST_ATTR\[26:24\]](#) LIST_NUM is busy then the [VPE_LIST_ADDR\[31:0\]](#) LIST_ADDR and [VPE_LIST_ATTR](#) registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

12.3.9.7.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

12.3.9.7.2.1 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are VIP1_PORTA_LUMA and VIP1_PORTA_CHROMA for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

12.3.9.7.2.2 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are VIP1_PORTA_LUMA or VIP1_PORTA_CHROMA depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

12.3.9.7.2.3 Single RGB Stream

If the port is configured to be used to send out RGB stream then the channel VIP1_PORTA_RGB must be used. The incoming data is then assumed to be RGB 888 data and this is combined with the Background Color Alpha register field to make ARGB8888 data that will then be sent out based on the data type. If the data type uses less than the full 8 bits the lower bits are dropped and just the upper bits are sent to get the correct data format.

12.3.9.8 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

12.3.9.8.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

12.3.9.8.1.1 Y 4:4:4 (Data Type 0)

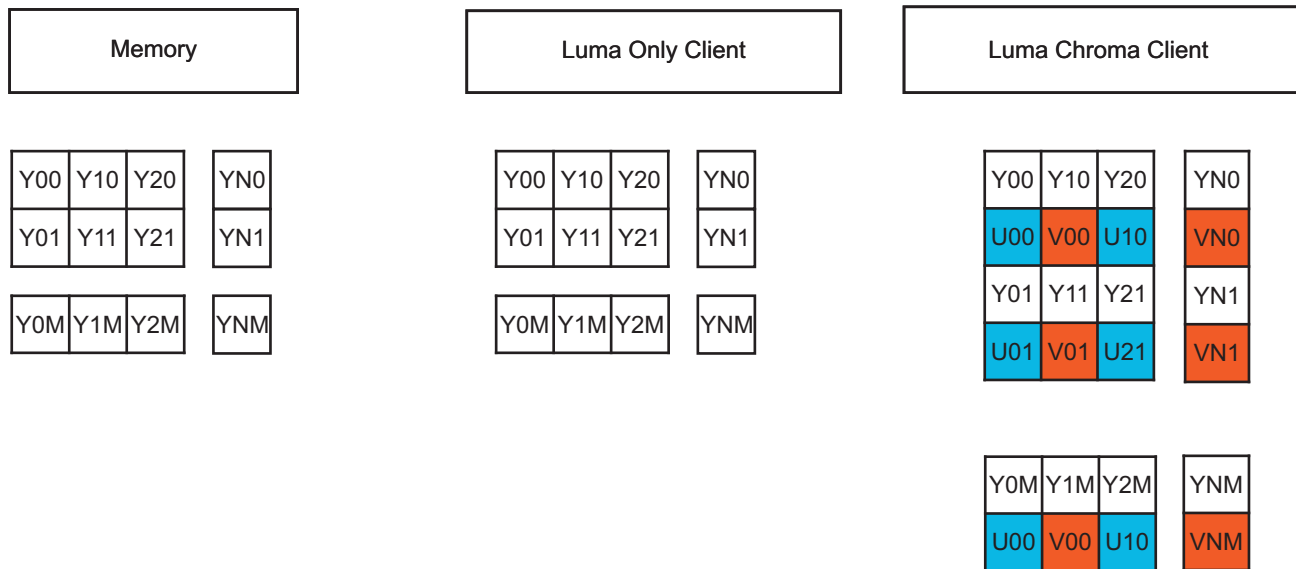

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

Figure 12-51. Y 4:4:4 (Data Type 0)

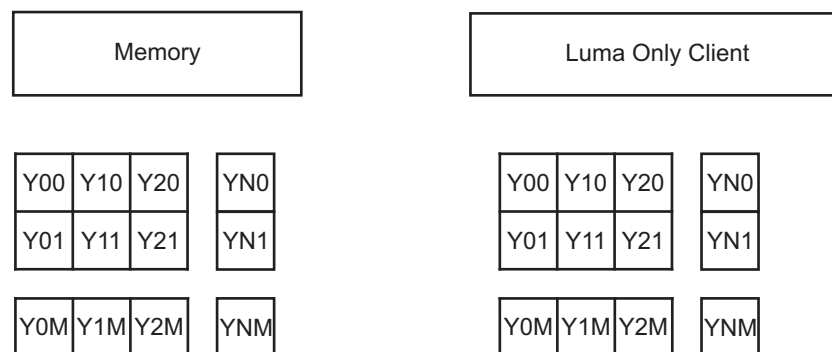

12.3.9.8.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

Figure 12-52. Y 4:2:2 (Data Type 1)

12.3.9.8.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 12-53. Y 4:2:0 (Data Type 2)

12.3.9.8.1.4 C 4:4:4 (Data Type 4)

The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

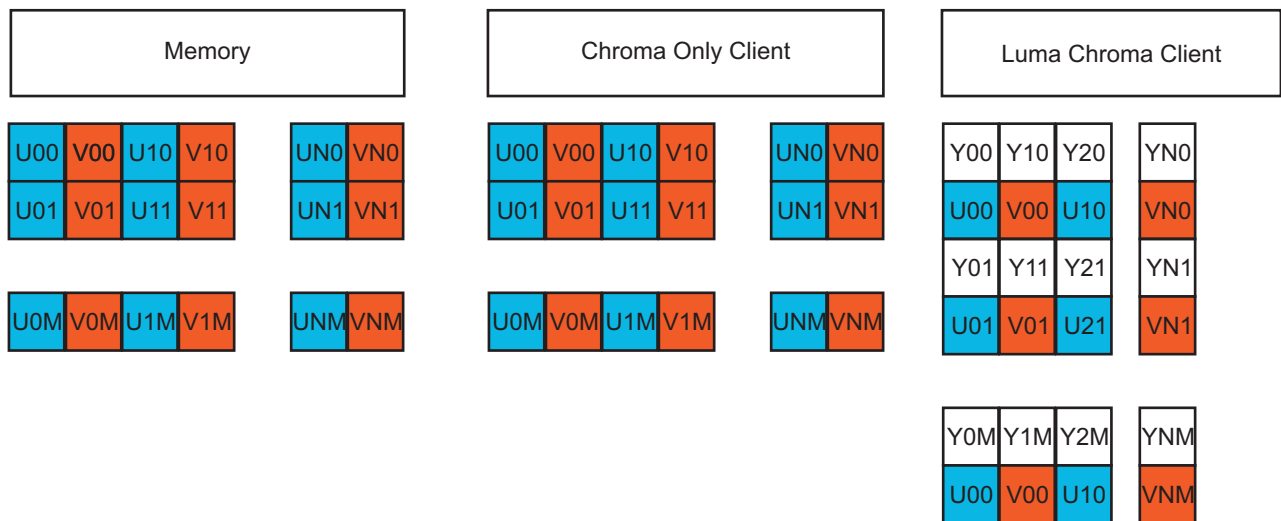

Figure 12-54. C 4:4:4 (Data Type 4)

12.3.9.8.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

Figure 12-55. C 4:2:2 (Data Type 5)

12.3.9.8.1.6 C 4:2:0 (Data Type 6)

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

Figure 12-56. C 4:2:0 (Data Type 6)

12.3.9.8.1.7 YC 4:2:2 (Data Type 7)

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

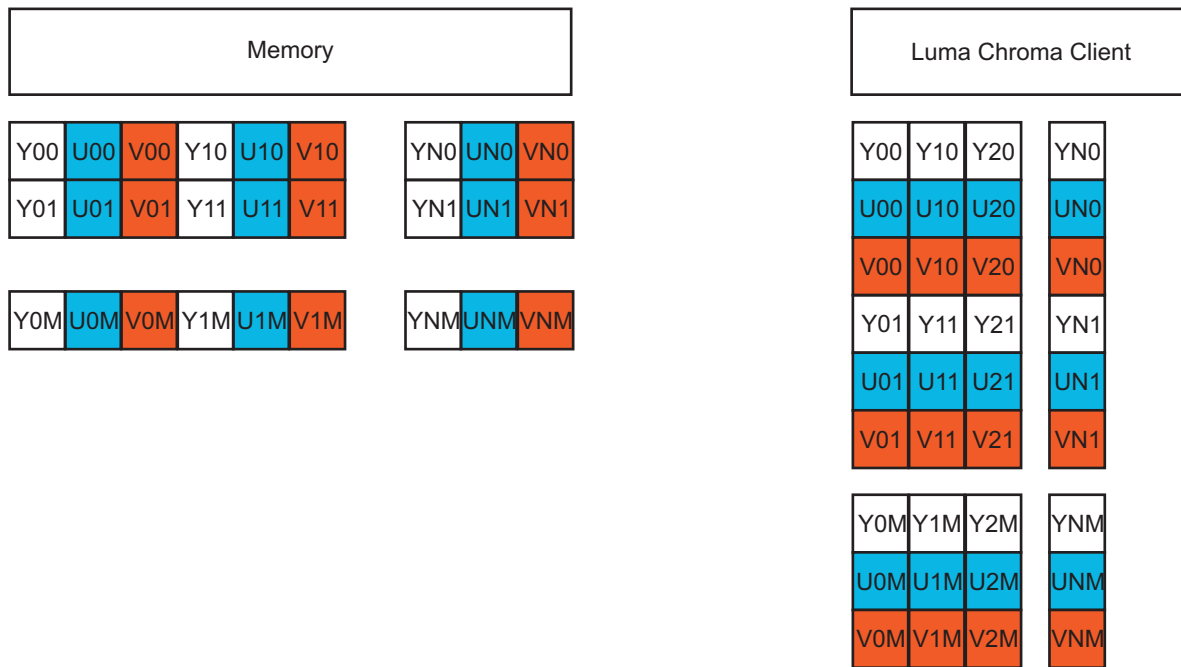

Figure 12-57. YC 4:2:2 (Data Type 7)

12.3.9.8.1.8 YC 4:4:4 (Data Type 8)

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

Figure 12-58. YC 4:4:4 (Data Type 8)

12.3.9.8.1.9 CY 4:2:2 (Data Type 23)

The CY 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Cb in the lowest byte followed by Y0 followed by Cr finally Y1 in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 12-59. CY 4:2:2 (Data Type 23h)

12.3.9.8.2 RGB Data Formats

The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less than the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

12.3.9.8.2.1 Input Data Formats

12.3.9.8.2.1.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 12-60. RGB16-565 (Data Type 0)

12.3.9.8.2.1.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 12-61. ARGB-1555 (Data Type 1)

12.3.9.8.2.1.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

Figure 12-62. ARGB-4444 (Data Type 2)

12.3.9.8.2.1.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 12-63. RGBA-5551 (Data Type 3)

12.3.9.8.2.1.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

Figure 12-64. RGBA-4444 (Data Type 4)

12.3.9.8.2.1.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 12-65. ARGB24-6666 (Data Type 5)

12.3.9.8.2.1.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the `VPE_BG_RGB` Blend value for the Blend value.

Figure 12-66. RGB24-888 (Data Type 6)

12.3.9.8.2.1.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

Figure 12-67. ARGB32-8888 (Data Type 7)

12.3.9.8.2.1.9 RGBA24-6666 (Data Type 8)

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

Figure 12-68. RGBA24-6666 (Data Type 8)

12.3.9.8.2.1.10 RGBA32-8888 (Data Type 9)

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 12-69. RGBA32-8888 (Data Type 9)

12.3.9.8.2.2 Output Data Formats

12.3.9.8.2.2.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

Figure 12-70. RGB16-565 (Data Type 0)

12.3.9.8.2.2.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

Figure 12-71. ARGB-1555 (Data Type 1)

12.3.9.8.2.2.3 ARGB-4444 (Data Type 2)

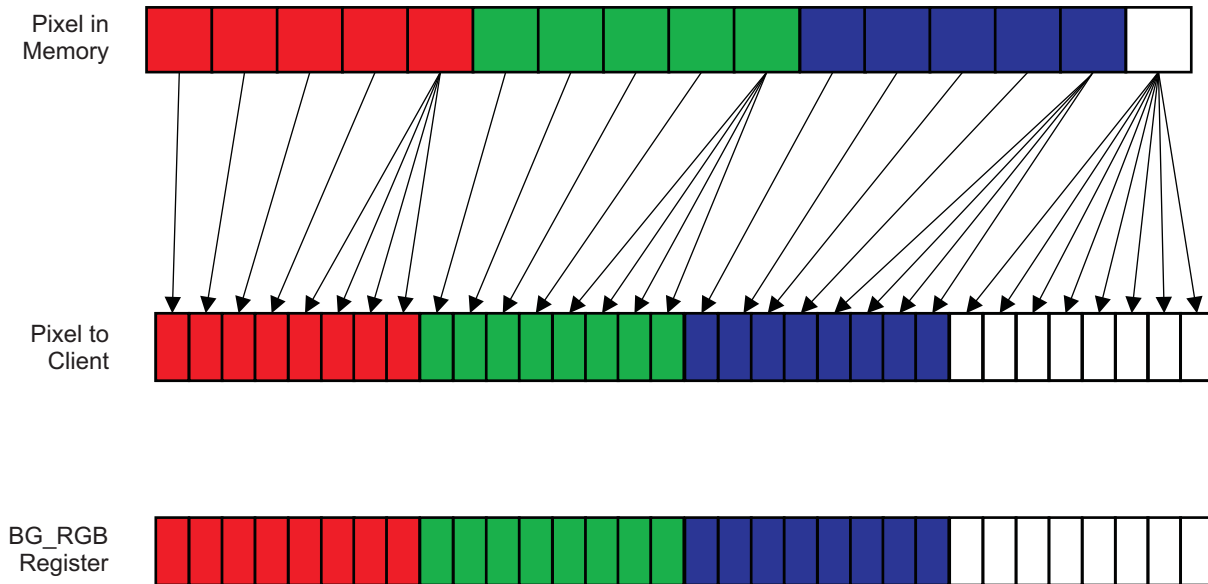

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

Figure 12-72. ARGB-4444 (Data Type 2)

12.3.9.8.2.2.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

Figure 12-73. RGBA-5551 (Data Type 3)

12.3.9.8.2.2.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

Figure 12-74. RGBA-4444 (Data Type 4)

12.3.9.8.2.2.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

Figure 12-75. ARGB24-6666 (Data Type 5)

12.3.9.8.2.2.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the `VPE_BG_RGB` Blend value for the Blend value.

Figure 12-76. RGB24-888 (Data Type 6)

12.3.9.8.2.2.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

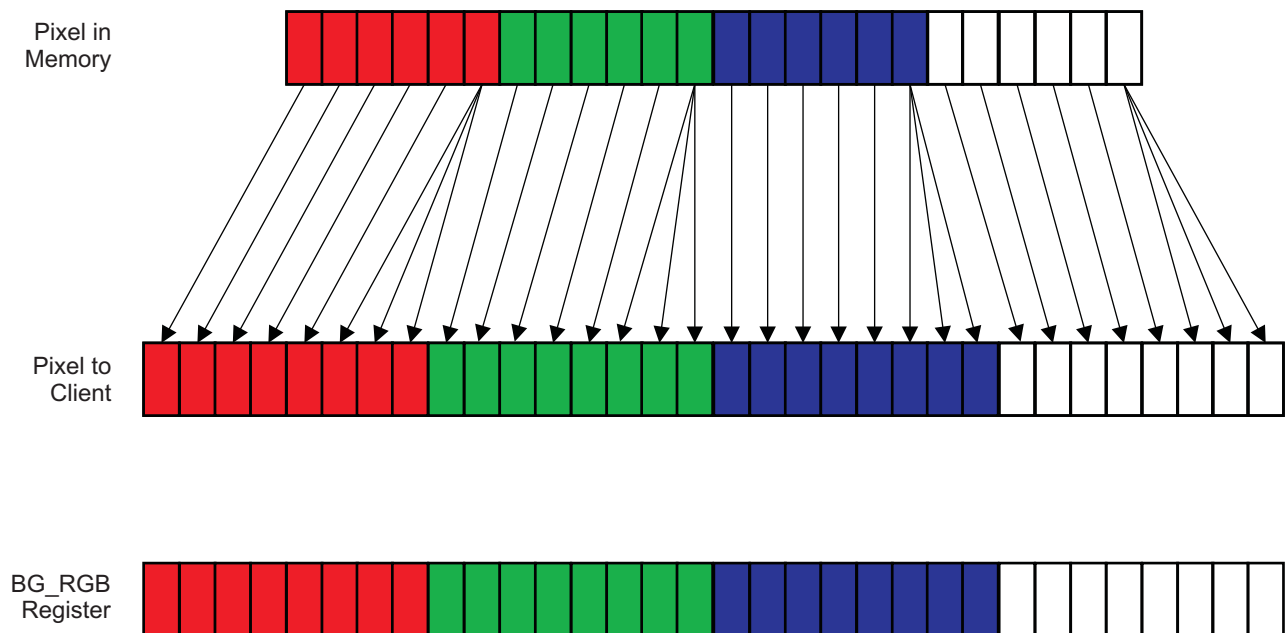

Figure 12-77. ARGB32-8888 (Data Type 7)

12.3.9.8.2.2.9 **RGBA24-6666 (Data Type 8)**

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

Figure 12-78. RGBA24-6666 (Data Type 8)

12.3.9.8.2.2.10 **RGBA32-8888 (Data Type 9)**

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 12-79. RGBA32-8888 (Data Type 9)

12.3.9.8.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

12.3.10 VPE Software Reset

Software reset in the VPE module can be done by setting the [VPE_CLKC_RST\[1\]](#) PRIM_DP_RST and [VPE_CLKC_RST\[0\]](#) VPDMA_RST for VPE VPDMA to 0x1. Software must ensure that the software reset completes before performing operations within the VPE module.

12.3.11 VPE Power and Clocks Management

The VPE modules support the MStandby/Wait and IdleReq/SidleAck protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

Power Management within the VPE module can be accomplished in several ways:

- L4 MConnect/SConnect can disable the internal L4 clock network
- L3 MConnect/Sconnect can disable the internal L3 clock network

These items are accomplished using the standard slave idle (for L4) and master standby (for L3) protocols. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shut down applies to the clock signals - L3_CLK and L4_CLK.

12.3.11.1 VPE Clocks

The VPE internal clock domains can only be shut down by writing the appropriate register bit within the Clock Enable register - [VPE_CLKC_CLKEN\[1\]](#) PRIM_DP_EN and [VPE_CLKC_CLKEN\[0\]](#) VPDMA_EN for the VPDMA engine

12.3.11.2 VPE Idle Mode

The VPE supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the [VPE_SYSCONFIG\[3:2\]](#) IDLEMODE bit field.

Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.

- Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements.
- No-idle mode: local target never enters idle state.
- Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA related requests) wakeup events

12.3.11.3 VPE StandBy Mode

The VPE supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the [VPE_SYSCONFIG\[5:4\]](#) STANDBYMODE bit field.

Configuration of the local initiator state management mode:

- Force-standby mode: local initiator is unconditionally placed in standby state.
- No-standby mode: local initiator is unconditionally placed out of standby state.

12.4.2.2 VPE_CSC Register Description

Table 12-57. VPE_CSC00

Address Offset	0x0000 0000	Instance	VPE_CSC
Physical Address	0x489D 5700		
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								B0								RESERVED								A0							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED		R	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of -4. to +4 represent in Q3.10 format. The MSB is sign bit. (Same format conversion as A0 in VPE_CSC00)	RW	0x0
15:13	RESERVED		R	0x0
12:0	A0	Its is represented as Q3.10 number. So the value ranges from -4 to +4. To convert a decimal number, multiply the number by 1024 and write it in the register in hex format. <ul style="list-style-type: none"> For example, to program 0.673, 0x2B1 should be written in the register. $(\text{int})(0.673 \times 1024) = (\text{int})689.152 = 689 = 0x2B1$. If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is - 1.893, 0x186E needs to be written in the register. $(\text{int})(-1.893 \times 1024) = -1938 = 0x186E$ (2'S compliment format of -1938 in 13-bit width) 	RW	0x0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MDT_MVSTMAX_COR_THR				MDT_MV_COR_THR				MDT_SF_SC_THR3								MDT_SF_SC_THR2								MDT_SF_SC_THR1							

Bits	Field Name	Description	Type	Reset
31:28	MDT_MVSTMAX_COR_THR	This is used for increasing noise robustness. Increasing this threshold leads to more robustness to noise, but with the potential of introducing ghosting effect. Note that this threshold is used for motion values for EDI only, and it is in addition mdt_mv_cor_thr.	RW	0x0
27:24	MDT_MV_COR_THR	This threshold is for the coring for motion value, mv. MDT will become more noise robust if this value increases. But the picture may be washed out if this value is set to high. This threshold can be interpreted as the noise threshold for calculating motion values for all blocks.	RW	0x0
23:16	MDT_SF_SC_THR3	Spatial frequency threshold 3	RW	0x0
15:8	MDT_SF_SC_THR2	Spatial frequency threshold 2	RW	0x0
7:0	MDT_SF_SC_THR1	Spatial frequency threshold It is used for adaptive scaling of motion values according to how busy the texture is. If the texture is flat, motion values need to be scaled up to reflect the sensitivity of motion values with respect to the detection error. Increasing the thresholds will make the motion value scaling more sensitive to the frequency of the texture. Note: 0 = mdt_sf_sc_thr1 = mdt_sf_sc_thr2 = mdt_sf_sc_thr3	RW	0x0

Bits	Field Name	Description	Type	Reset
31:24	EDI_COR_SCALE_FACTOR	Scaling factor for correlation along detected edge	RW	0x0
23:16	EDI_DIR_COR_LOWER_THR	Lower threshold used for correlation along detected edge	RW	0x0
15:8	EDI_CHROMA3D_COR_THR	Correlation threshold used in 3D processing for chroma. Because the motion values used for chroma 3D processing are based on luma only. Extra protection is needed. Temporal interpolation is only performed for chroma, when there is strong spatial or temporal correlation for the chroma pixel being processed. When the pixel difference is less than this threshold, it is assumed that there exists strong correlation between these two pixels. Thus, increasing this value leads to more chroma pixels being processed in 3D	RW	0x0
7:4	RESERVED		R	0x0

FMD_CAF_LINE_THR								FMD_CAF_FIELD_THR								RESERVED								FMD_BED_ENABLE	FMD_JAM_DIR	FMD_LOCK	FMD_ENABLE				

Bits	Field Name	Description	Type	Reset
31:24	FMD_CAF_LINE_THR	CAF threshold used for the pixels from two lines in one field This is the threshold used for combing artifacts detection. The difference of two consecutive lines from the same field (so there is one line in between if two fields are merged into one progressive frame) is compared with this threshold. Decreasing this threshold leads to be more conservative in detecting CAF. Both fmd_caf_field_thr and fmd_caf_line_thr are close the values that two pixels differed by this value is observable.	RW	0x0
23:16	FMD_CAF_FIELD_THR	CAF threshold used for the pixels from two fields This is the threshold used for combing artifacts detection. The difference of two consecutive lines (when merging two fields into one progressive frame) is used to compare with this threshold. Increasing this threshold leads to be more conservative in detecting CAF.	RW	0x0
15:4	RESERVED		R	0x0
3	FMD_BED_ENABLE	Film Mode Bad Edit Detection 0x0 : Disable 0x1 : Enable	RW	0x0
2	FMD_JAM_DIR	Film Mode Field Jamming Direction 0x0 : Current field jammed with previous field 0x1 : Current field jammed with next field	RW	0x0
1	FMD_LOCK	Film Mode Field Jamming Direction 0x0 : Current field jammed with previous field 0x1 : Current field jammed with next field	RW	0x0
0	FMD_ENABLE	Enable film mode processing 0x0 : Disable 0x1 : Enable	RW	0x0

12.4.6 VPE_VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VPE VPDMA in this family of devices:

- All VPE_INT1_* registers
- All VPE_INT2_* registers
- All VPE_INT3_* registers

The following channels are not used by VPE VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- VIP1_*, except for the following:
 - VIP1_PORTA_RGB
 - VIP1_PORTA_LUMA
 - VIP1_PORTA_CHROMA
 - VIP2_*
 - GRPX_*
 - SCALER_OUT
 - SCALER_LUMA
 - SCALER_CHROMA
 - NF_*
 - TRANSCODE1_*
 - TRANSCODE2_*
 - AUX_IN
 - PIP_FRAME
 - POST_COMP_WR
 - VBI_SD_VENC
-

NOTE: The following clients are not used by VPE VPDMA in this family of devices. All register bit-fields corresponding to these clients should be kept at their reset value.

- VIP1_*, except for the following:
 - VIP1_UP_UV
 - VIP1_UP_Y
- VIP2_*
- TRANS1_LUMA
- TRANS1_CHROMA
- TRANS2_LUMA
- TRANS2_CHROMA
- HDMI_WRBK
- VBI_SDVENC
- NF_420_UV_OUT
- NF_420_Y_OUT
- NF_420_UV_IN
- NF_420_Y_IN
- NF_422_IN
- GRPX1_ST
- GRPX2_ST
- GRPX3_ST
- GRPX1_DATA
- GRPX2_DATA
- GRPX3_DATA
- PIP_WRBK
- SC_IN_*
- SC_OUT
- COMP_WRBK

12.4.6.2 VPE_VPDMA Register Description

Table 12-161. VPE_VPDMA_PID

Address Offset	0x0000 0000	Instance	VPE_VPDMA
Physical Address	0x489D D000		
Description	This register follows the format described in PDR3.5		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SCHEME		FUNC															RTL				MAJOR		VPDMA_LOAD_COMPLETE	VPDMA_ACCESS_TYPE	MINOR						

Bits	Field Name	Description	Type	Reset
31:30	SCHEME	The scheme of the register used. Currently this is PDR 3.5 Scheme	R	0x0
29:16	FUNC	The function of the module being used. The value is for vpe0_vayu_vpdma.	R	0x0
15:11	RTL	RTL Release Version The PDR release number of this IP. After Bootup this value becomes the firmware Revision ID	R	0x0
10:8	MAJOR	Major Release Number	R	0x0
7	VPDMA_LOAD_COMPLETE	This bit will be 1 when the VPDMA state machines image and data image have successfully been fetched and loaded.	R	0x0
6	VPDMA_ACCESS_TYPE	After bootup this bit states how DMA transaction are setup by lists or through register access. 0x0 : Lists 0x1 : Register Access	R	0x0
5:0	MINOR	Minor Release Number	R	0x0

Table 12-163. VPE_LIST_ADDR

Address Offset	0x0000 0004	Instance	VPE_VPDMA
Physical Address	0x489D D004		
Description	The location of a new list to begin processing.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LIST_ADDR																															

Bits	Field Name	Description	Type	Reset
31:0	LIST_ADDR	Location of a new list of descriptors. This register must be written with the VPDMA Configuration Location after reset.	RW	0x0

Table 12-164. Register Call Summary for Register VPE_LIST_ADDR

VPE Functional Description

Table 12-165. VPE_LIST_ATTR

Address Offset	0x0000 0008	Instance	VPE_VPDMA
Physical Address	0x489D D008		
Description	The attributes of a new list. This register should always be written after list_addr.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				LIST_NUM			RESERVED	STOP	RDY	LIST_TYPE			LIST_SIZE																		

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at LIST_ADDR. If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VPE_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated. 0x0 : Normal List 0x1 : Self-Modifying List 0x2 : List Doorbell Others Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last read DMA transaction has occurred for channel grpx3 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx3_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last read DMA transaction has occurred for channel grpx2 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx2_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last read DMA transaction has occurred for channel grpx1 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx1_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_HQ_VID2_LUMA	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_HQ_VID1_CHROMA	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_HQ_VID1_LUMA	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
27	INT_STAT_VIP1_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP1_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_VIP1_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sd_venc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel nf_write_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

28	INT_STAT_CONTROL_DESCRIPTOR_INT12	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Table 12-323. VPE_PRI_CHROMA_CSTAT

Address Offset	0x0000 0300	Instance	VPE_VPDMA
Physical Address	0x489D D300		
Description	The register holds status information and control for the client.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REQ_DELAY								REQ_RATE								BUSY	DMA_ACTIVE	FRAME_START	LINE_MODE	RESERVED											

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles..This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles.This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client. 0 : Change in value of hdmi_field_id 1 : Change in value of dvo2_field_id 2 : Change in value of hdcomp_field_id 3 : Change in value of sd_field_id 4 : Use List Manager Internal Field0 5 : Use List Manager Internal Field1 6 : Use List Manager Internal Field2 7 : Start on channel active	RW	0x0
9:8	LINE_MODE	Selects the output mode of the line buffer. 0: repeat lines twice each output data line gets 2 times the number of frame lines. 1: each line once with Line Buffer Disabled, so no mirroring. Each line gets frame lines with identical data. 2: Each line seen once Mirroring is enabled so the top lines get the top lines repeated at the top of the frame and the bottom lines have the bottom lines repeated. Each line of data gets frame lines + number of buffered lines. 3: each line once only on one line. Each data line gets number of frame lines divided by number of buffered lines.	RW	0x0
7:0	RESERVED		R	0x0

Table 12-325. VPE_PRI_LUMA_CSTAT

Address Offset	0x0000 0304	Instance	VPE_VPDMA
Physical Address	0x489D D304		
Description	The register holds status information and control for the client.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REQ_DELAY								REQ_RATE								BUSY	DMA_ACTIVE	FRAME_START	RESERVED												

Bits	Field Name	Description	Type	Reset
31:24	REQ_DELAY	The minimum number of clock cycles between requests being issued. This value is multiplied by 32 to get the actual number of cycles. This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins and the first request of a frame will go as soon as possible.	RW	0x0
23:16	REQ_RATE	The number of clock cycles between the last two requests issued. This value is multiplied by 32 to get the actual number of cycles. This value is only accurate for the current frame. The internal counters used to calculate the rate are reset when a new frame begins.	R	0x0
15	BUSY	Signals if the client is currently active. This bit is set as soon as we the channel is received by the client from the list manager and is cleared when the channel is cleared from the shared memory.	R	0x0
14	DMA_ACTIVE	Signals if the client is currently actively sending DMA requests	R	0x0
13:10	FRAME_START	The source of the start frame event for the client. 0 : Change in value of hdmi_field_id 1 : Change in value of dvo2_field_id 2 : Change in value of hdcomp_field_id 3 : Change in value of sd_field_id 4 : Use List Manager Internal Field0 5 : Use List Manager Internal Field1 6 : Use List Manager Internal Field2 7 : Start on channel active	RW	0x0

5:4	STANDBYMODE	Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state 0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only 0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only 0x2: Same behavior as bit-field value of 0x1. 0x3: Reserved	RW	0x2
3:2	IDLEMODE	Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state 0x0: Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only 0x1: No-idle mode: local target never enters idle state. Backup mode, for debug only 0x2: Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wakeup events 0x3: Smart-idle wakeup-capable mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module may generate (IRQ- or DMA-request-related) wakeup events when in idle state. Mode is only relevant if the appropriate IP module "wakeup" output(s) is (are) implemented	RW	0x2
1:0	RESERVED		R	0x0

Display Subsystem

This chapter describes the display subsystem for the device.

NOTE: All the Display and HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which Display and HDMI features are supported.

Topic	Page
13.1 Display Subsystem Overview	4129
13.2 Display Controller	4185
13.3 High-Definition Multimedia Interface	4467

13.1 Display Subsystem Overview

The Display Subsystem (DSS) provides the logic to display a video frame from the system memory frame buffer on a liquid-crystal display (LCD) panel or TV set.

The display subsystem can display different pictures simultaneously by using three LCD outputs (LCD1, LCD2, and LCD3), in addition to a TV output.

All three LCD outputs are available on three parallel interfaces (DPI1, DPI2, and DPI3), providing support for MIPI DPI 2.0, or BT-656 or BT-1120.

The TV output is available on one of the following interfaces

- High-Definition Multimedia Interface (HDMI)
- DPI1 parallel interface

The modules integrated in the display subsystem are:

- Display controller (DISPC):
 - One direct memory access (DMA) engine
 - One graphics pipeline (GFX), three video (VID) pipelines, and one write-back (WB) pipeline
 - Three LCD outputs and one TV output, each with a dedicated overlay manager
- HDMI protocol engine:
 - HDMI 1.4a support up to 1080p@60Hz (including 3D frame-packing support)
 - 36-bit RGB color
 - HDCP 1.4 key protection
 - Deep color mode support (10-bit/12-bit for 148.5-MHz pixel clock)

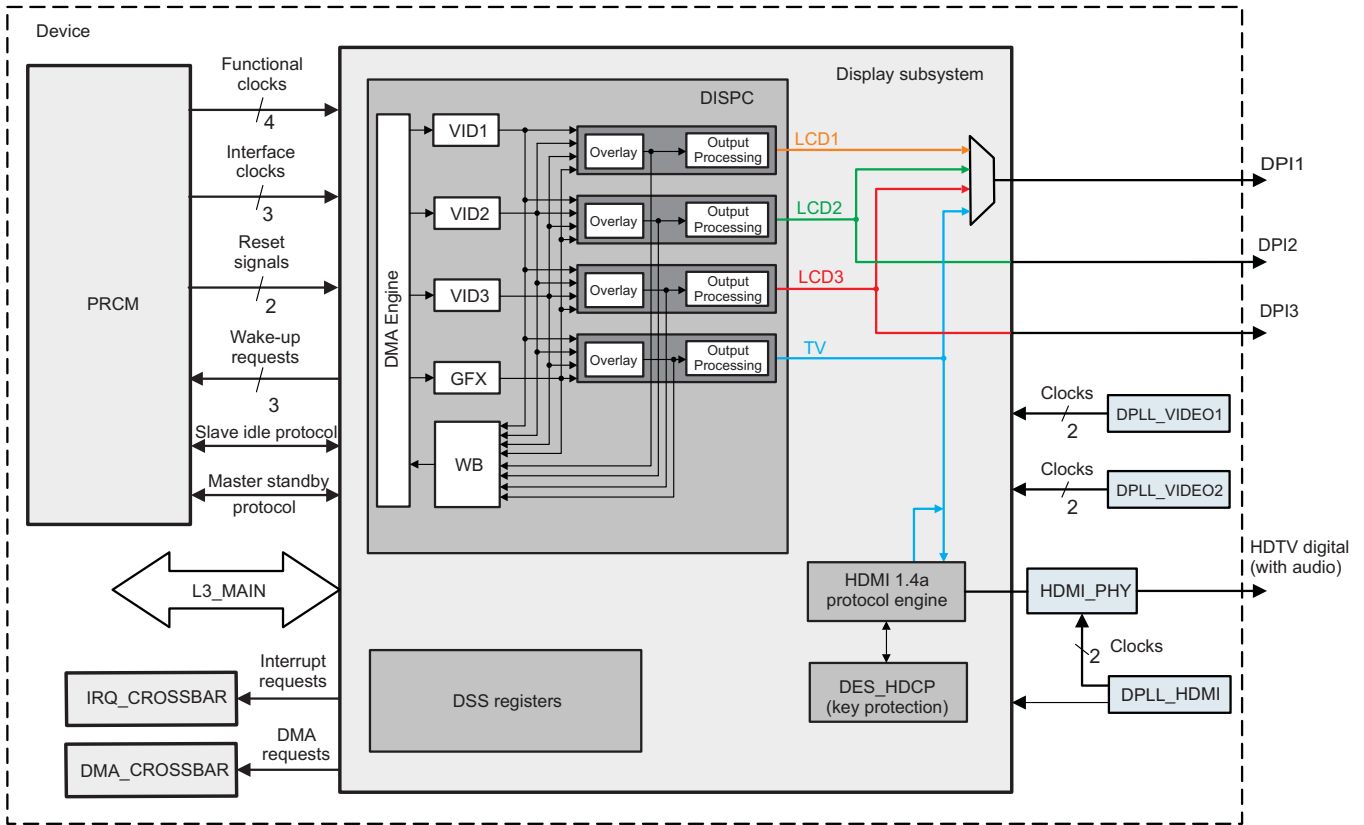

The necessary video phase-locked loops (PLLs) with their corresponding control modules, and the physical layer (PHY) for HDMI are outside the display subsystem. The video PLLs allow independent display outputs at different frequencies. The supported PLLs and PHY are:

- DPLL_HDMI / HDMI_PHY
- DPLL_VIDEO1
- DPLL_VIDEO2

To ensure efficient bandwidth, the display subsystem integrates a connection between the device L3_MAIN interconnect and the DISPC to exchange data with synchronous dynamic random access memory (SDRAM) using the DISPC DMA engine. The same connection is also used for configuration.

[Figure 13-1](#) is a high-level diagram of the display subsystem.

Figure 13-1. Display Subsystem Overview

dss-001

13.1.1 Display Subsystem Environment

This section describes the various outputs handled by the display subsystem:

- LCD support
- TV display support

Figure 13-2 is a diagram of the display subsystem environment.

Figure 13-2. Display Subsystem Environment

dss-002

NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see [Section 20.4.6.1.1 Pad Configuration Registers](#) in [Chapter 20, Control Module](#).

13.1.1.1 Display Subsystem LCD Support

LCD panels can be connected to the display subsystem of the device using DPI1, DPI2, and/or DPI3 parallel interfaces.

13.1.1.1.1 Display Subsystem LCD with Parallel Interfaces

Using parallel output mode, the module on the display subsystem processing path is DISPC.

In synchronous parallel interface, the required data and control signals are provided directly to external MIPI DPI 2.0, or BT-656 or BT-1120 compatible parallel panels.

The DISPC is connected to the system memory through the device L3_MAIN interconnect and uses its own DMA engine (with embedded FIFO) to read data from the system memory. For more details, see [Section 13.2.1, Display Controller](#).

All three DISPC LCD outputs are available for DSS DPI1 output, with selection done through the [DSS_CTRL\[17:16\] PARALLEL_SEL](#) bit field (multiplexer 13 in [Figure 13-2](#)). DSS DPI2 and DPI3 outputs are hardwired to DISPC LCD2 and LCD3 outputs.

[Table 13-1](#) to [Table 13-3](#) lists the outgoing display subsystem signals on the device boundary pads.

Table 13-1. Display Subsystem DPI1 Interface Signals Mapping

Signal Names at Device Pads (See Figure 13-2)	DSS_CTRL[17:16] PARALLEL_SEL = 1, 2, or 3 DISPC LCDx Channel Out (pixel data, clock, syncs) (where x = 1, 2, or 3)
vout1_fid	DISPC_LCDx_FID
vout1_clk	DISPC_LCDx_PCLK
vout1_de	DISPC_LCDx_DE
vout1_vsync	DISPC_LCDx_VSYNC
vout1_hsync	DISPC_LCDx_HSYNC
vout1_d[23:0]	DISPC_LCDx_DATA[23:0]

NOTE: By default, [DSS_CTRL\[17:16\] PARALLEL_SEL = 0x0](#), and DISPC TV data and HDMI clk/sync signals are output on DPI1 interface pins. Software must program the [PARALLEL_SEL](#) bit-field to value other than 0x0, in order DISPC LCD data and clk/sync signals to be output on DPI1 interface pins.

Table 13-2. Display Subsystem DPI2 Interface Signals Mapping

Signal Names at Device Pads (See Figure 13-2)	DISPC LCD2 Channel Out (pixel data, clock, syncs)
vout2_fid	DISPC_LCD2_FID
vout2_clk	DISPC_LCD2_PCLK

vout2_vsync	DISPC_LCD2_VSYNC
vout2_hsync	DISPC_LCD2_HSYNC
vout2_d[23:0]	DISPC_LCD2_DATA[23:0]

Table 13-3. Display Subsystem DPI3 Interface Signals Mapping

Signal Names at Device Pads (See Figure 13-2)	DISPC LCD3 Channel Out (pixel data, clock, syncs)
vout3_fid	DISPC_LCD3_FID
vout3_clk	DISPC_LCD3_PCLK
vout3_de	DISPC_LCD3_DE
vout3_vsync	DISPC_LCD3_VSYNC
vout3_hsync	DISPC_LCD3_HSYNC
vout3_d[23:0]	DISPC_LCD3_DATA[23:0]

For more details on LCD output pixel data formats for the parallel interface, see [Section 13.2 DISPC Environment](#), in *Display Controller*.

13.1.1.2 Display Subsystem TV Display Support

When TV data flow is needed from the display subsystem, the DPI1 output or HDMI output can be used.

13.1.1.2.1 Display Subsystem TV With Parallel Interfaces

In synchronous parallel interface configuration, the required data is provided by the DISPC TV output, and control signals are provided by the HDMI module. Then they are merged and provided to the DPI1 output.

This configuration option is available and can be selected through the `DSS_CTRL[17:16] PARALLEL_SEL` bit field (multiplexer 13 in [Figure 13-4](#)).

[Table 13-4](#) lists the outgoing display subsystem signals on the device boundary pads.

Table 13-4. Display Subsystem TV Parallel Interface Signals Mapping

Signal Names at Device Pads (See Figure 13-2)	<code>DSS_CTRL[17:16] PARALLEL_SEL = 0</code> DISPC TV Channel Out (pixel data) HDMI (pixel clock, syncs)
vout1_fid	HDMI_M_FID
vout1_clk	DSS_HDMI_PCLK
vout1_de	HDMI_M_DE
vout1_vsync	HDMI_M_VS
vout1_hsync	HDMI_M_HS
vout1_d[23:0]	DISPC_TV_DATA[29:0]

For more details on TV output pixel data formats for the parallel interface, see [Section 13.2.2 DISPC Environment](#), in [Section 13.2.1 Display Controller](#).

13.1.1.2.2 Display Subsystem TV With Serial Interfaces

In serial interface configuration, the HDMI module is used. The DISPC, HDMI, DES_HDCP, and the associated HDMI PHY module are used in the data path. The HDMI module converts the RGB video into standard high-definition digital video format. The HDMI module has a dedicated PLL, which can multiply the pixel clock by an appropriate factor. The data is transmitted on three differential data pairs and an additional clock pair.

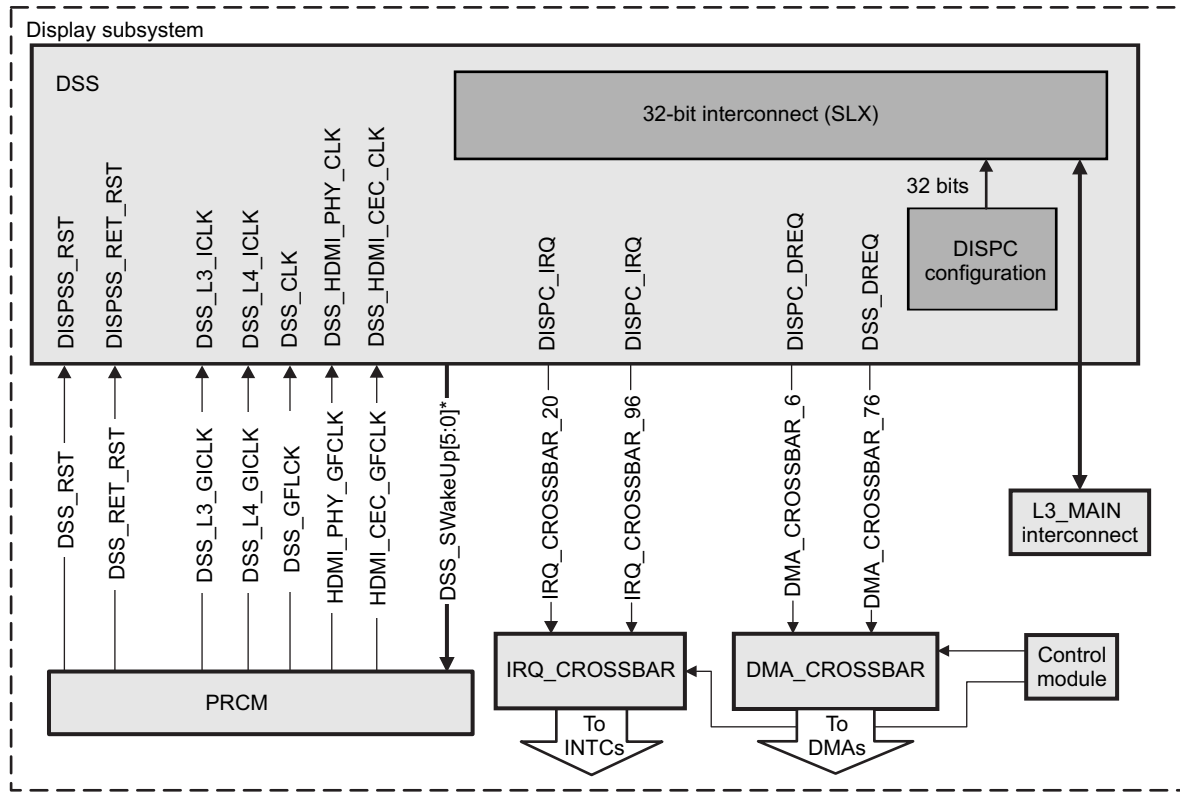

For more details, see [Section 13.3](#), in *High-Definition Multimedia Interface*.

13.1.2 Display Subsystem Integration

This section describes the integration of the display subsystem module in the device, including information about clocks, resets, and hardware requests.

[Figure 13-3](#) shows the integration of the display subsystem in the device.

Figure 13-3. Display Subsystem Integration

* Generic names, refer to appropriate subsection for details dss-003

Table 13-5. Display Subsystem Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	MPU_IRQ_25 DSP1_IRQ_58 DSP2_IRQ_58 IPU1_IRQ_26 IPU2_IRQ_26	DISPC interrupt requests.
HDMI	HDMI_IRQ	IRQ_CROSSBAR_96	MPU_IRQ_101 IPU1_IRQ_26 IPU2_IRQ_26	HDMI interrupt requests.
DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5 DMA_SYSTEM_DREQ_5	The line trigger signal to synchronize a memory-to-memory logical channel in the DMA is generated by the DISPC IP.
HDMI	DSS_DREQ	DMA_CROSSBAR_76	DMA_SYSTEM_DREQ_75	Display subsystem HDMI audio DMA request

NOTE: The “Default Mapping” column in [Table 13-5 Display Subsystem Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively. For more information about the IRQ_CROSSBAR module, see [Section 20.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 20, Control Module](#). For more information about the DMA_CROSSBAR module, see [Section 20.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 20, Control Module](#). For more information about the device interrupt controllers, see [Chapter 19, Interrupt Controllers](#). For more information about the device DMA_SYSTEM module, see [Section 18.1, System DMA](#). For more information about the device EDMA module, see [Section 18.2, Enhanced DMA](#).

13.1.2.1 Display Subsystem Clocks

The power, reset, and clock management (PRCM) module provides clock signals to the display subsystem.

Figure 13-4 shows the details of the display subsystem clock tree.

Figure 13-4. Display Subsystem Clock Tree

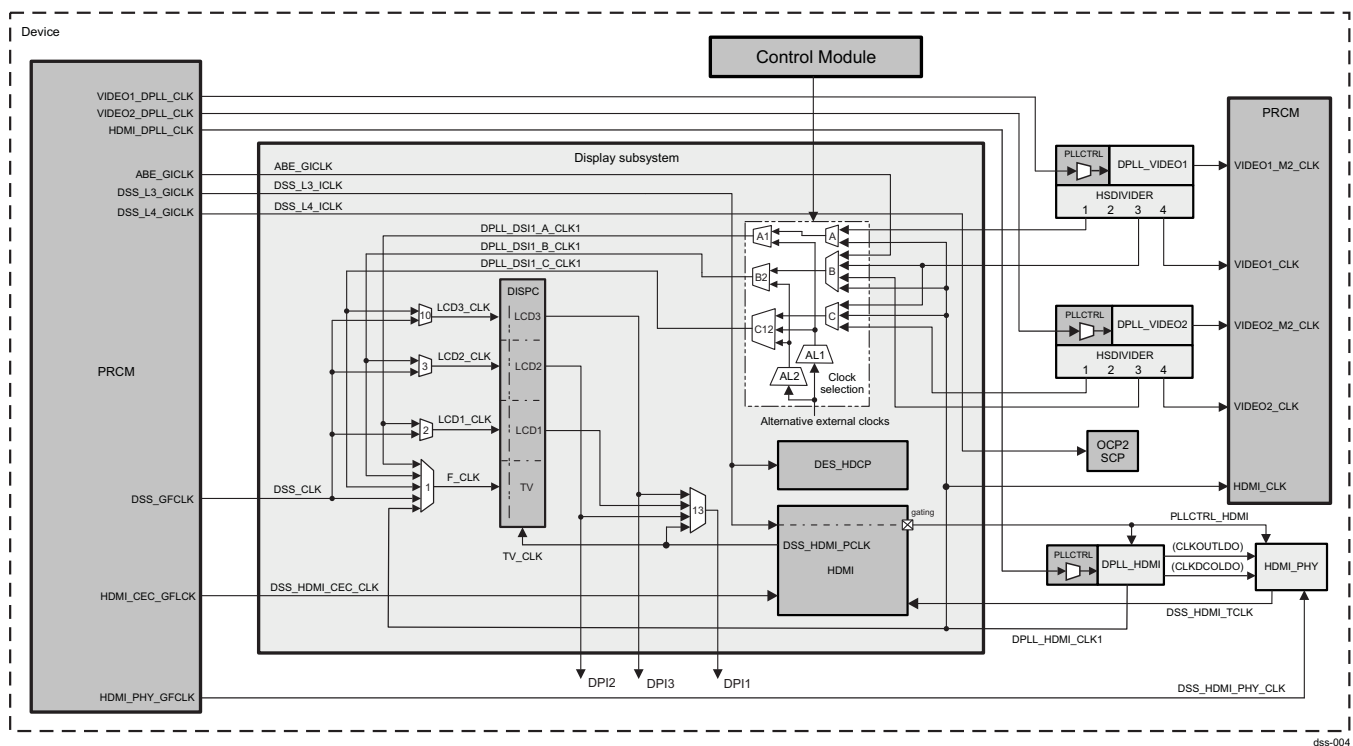

Table 13-6 lists the main DSS clocks and their sources.

Table 13-6. Display Subsystem Clocks

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DSS	DPLL_VIDEO1 input	VIDEO1_DPLL_CLK	PRCM module	Functional clock
DSS	DPLL_VIDEO2 input	VIDEO2_DPLL_CLK	PRCM module	Functional clock
DSS	DPLL_HDMI input	HDMI_DPLL_CLK	PRCM module	Functional clock

Table 13-6. Display Subsystem Clocks (continued)

DSS_L3_ICLK	DSS_L3_GICLK	PRCM module	Interface clock

DPI3 functional/pixel clock	DSS_DISPC_LCD3_PCLK	DISPC	N/A	N/A
HDMI timing clock (DSS_HDMI_TCLK)	N/A	HDMI_PHY	N/A	N/A

NOTE:

- In Figure 13-4, clkout1, clkout3, and clkout4 of DPLL_VIDEO1 and DPLL_VIDEO2 correspond to M4, M6, and M7 outputs of the associated HS divider module (HSDIVIDER). For more information on the configuration of DPLL_VIDEO clocks, see Section 13.1.3.3, *DPLL_VIDEO Functional Description*.
- For synchronization purpose, the clkout4 (M7) output of each HSDIVIDER is used to source McASP module and peripheral timers. For more information, see Chapter 24, *Timers*, and Section 26.6, *Multichannel Audio Serial Ports*.
- The multiplexers of the clock selection block in Figure 13-4 are controlled by DSS_PLL_CONTROL register in the device Control Module (see Chapter 20, *Control Module*, for more information):
 - Multiplexers A, B, and C are controlled by [4:3] DS11_A_CLK1_SELECTION, [6:5] DS11_B_CLK1_SELECTION, and [8:7] DS11_C_CLK1_SELECTION register bit-fields, respectively.
 - Multiplexers AL1 and AL2 are controlled by [28:26] ALTCLK1_SEL and [31:29] ALTCLK2_SEL register bit-fields. *[New DRA7xxP feature versus DRA75x/DRA74x]*
 - Multiplexers A1, B2, and C12 are controlled by [22] DS11_A_CLK1_ALTCLK1_SEL, [23] DS11_B_CLK1_ALTCLK2_SEL, and [25:24] DS11_C_CLK1_ALTCLK12_SEL register bit-fields, respectively. *[New DRA7xxP feature versus DRA75x/DRA74x]*

13.1.2.2 Display Subsystem Resets

The PRCM module provides two reset signals to the display subsystem.

Figure 13-5 shows the details of the reset tree for the display subsystem.

Figure 13-5. Display Subsystem Reset Scheme

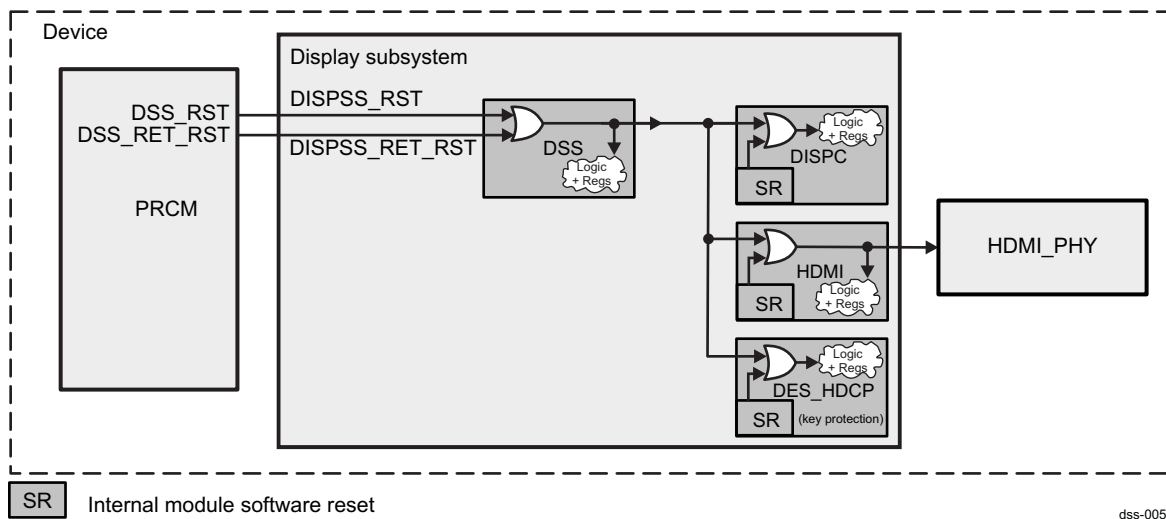

Table 13-8 lists the resets for the display subsystem.

Table 13-8. Display Subsystem Resets

Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DSS	DISPSS_RET_RST	DSS_RET_RST	PRCM module	Retention reset
	DISPSS_RST	DSS_RST	PRCM module	Nonretention reset

The display subsystem receives its DISPSS_RST reset signal (the reset signal of the display subsystem power domain) from the PRCM module. The DISPSS_RET_RST is used only for the DES_HDCP key protection module and HDMI.

13.1.2.3 Display Subsystem Power Management

The display subsystem modules are in the display subsystem power domain.

[Table 13-9](#) lists the power domains in the display subsystem.

Table 13-9. Display Subsystem Power Domains

Module Instance	Attributes
	Power Domain
Display subsystem	PD_DSS
DISPC	For more details, see Section 13.2.1 DISPC Overview , in <i>Display Controller</i> .
HDMI	For more details, see Section 13.3.1 HDMI Overview , in <i>High-Definition Multimedia Interface</i> .

13.1.2.3.1 Display Subsystem Standby Mode

As part of the system-wide power-management scheme, the display subsystem supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

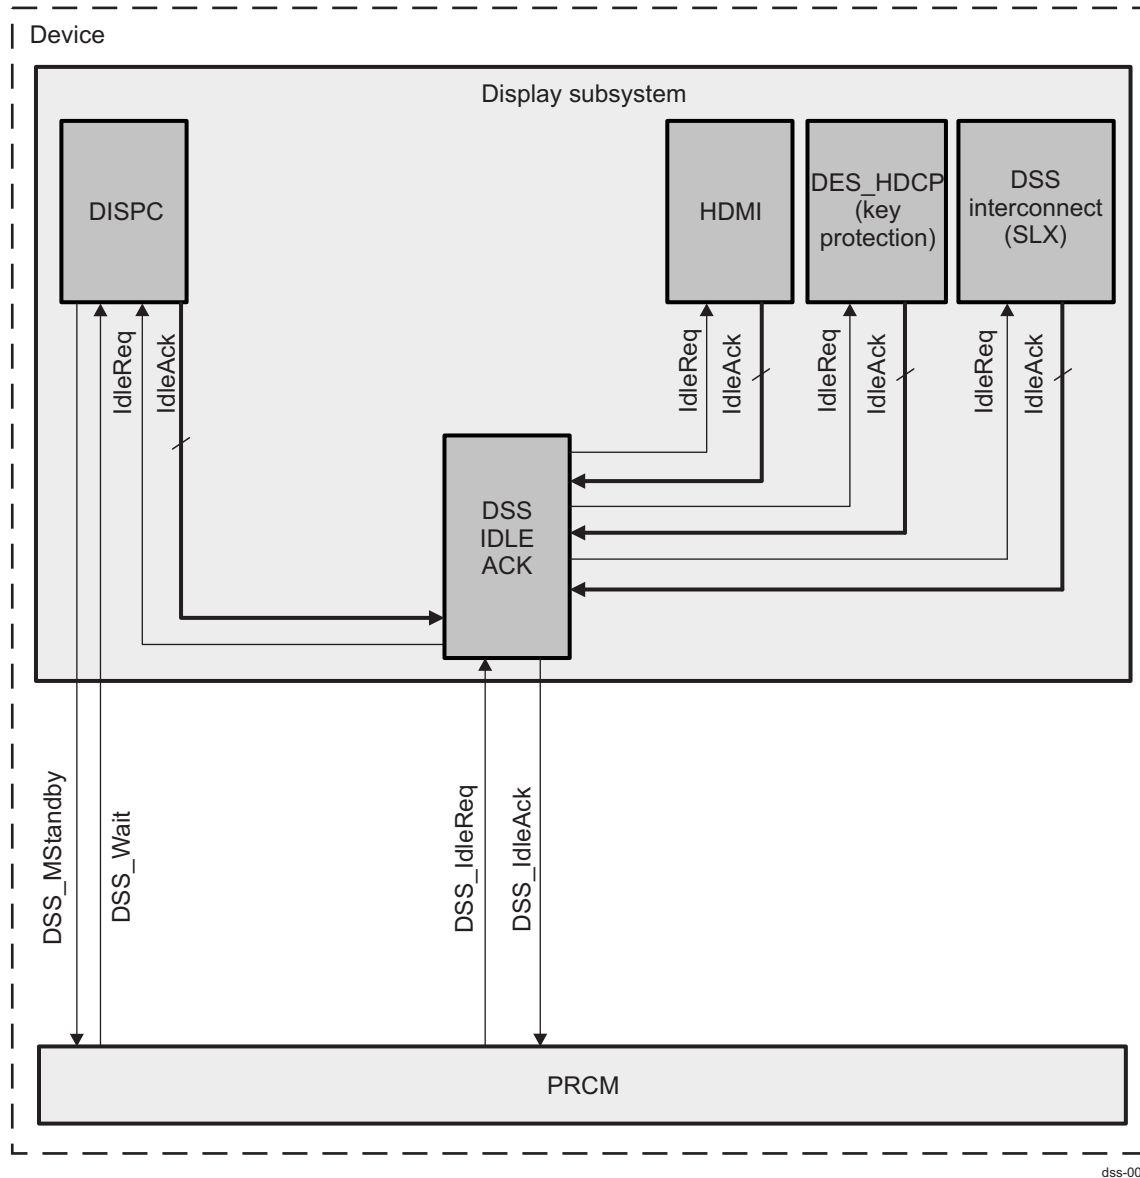

- MStandby/MWait
 - DISPC
- SIdleReq/SIdleAck
 - DISPC
 - HDMI
 - DES_HDCP (key protection)
 - DSS interconnect

The PRCM module asserts the MWait and received MStandby directly from DISPC. When the display subsystem initiates a standby procedure, it also initiates a master standby/wait protocols with the PRCM module that lets the PRCM module cut the display subsystem clocks. For information about the conditions that allow the subsystem to exit standby mode, see [Section 13.2.1 DISPC Overview](#), in *Display Controller*.

The PRCM also asserts the SIdleReq. Then, it is split at the display subsystem level and send to the appropriate modules. Consequently, all SIdleAck are merged into one and sent back to PRCM.

[Figure 13-6](#) shows the generation of SIdleAck/MStandby in the display subsystem.

Figure 13-6. Display Subsystem SIdleAck/MStandby Generation

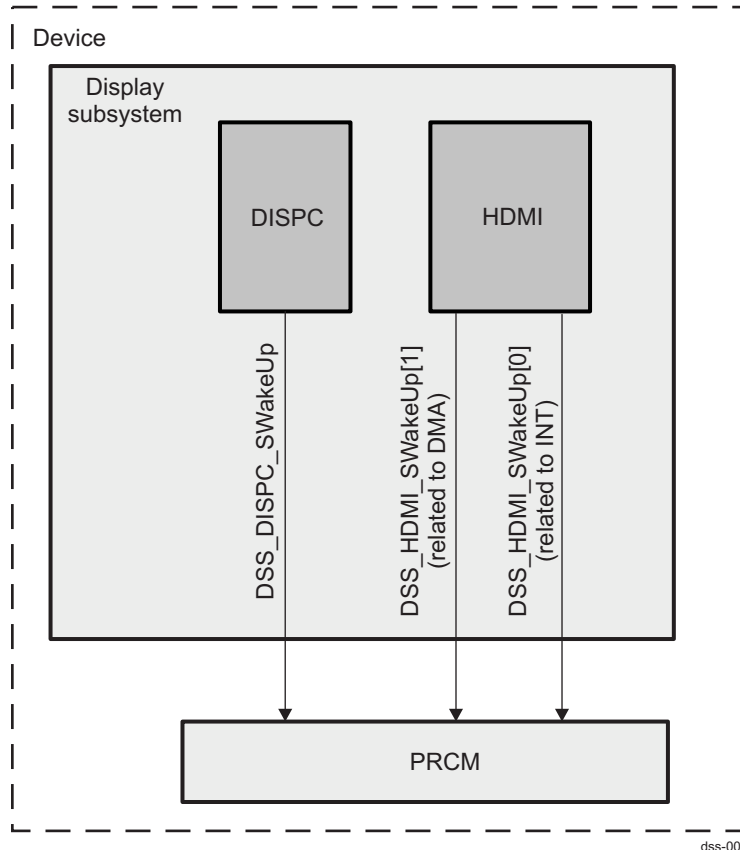

dss-006

13.1.2.3.2 Display Subsystem Wake-Up Mode

The DISPC and HDMI modules support the wake-up protocol. DSS_HDMI_SWakeUp is associated with HMDI_IRQ, which is generated by the HDMI module. For the events that generate an Swakeup and the description and configuration of the registers, see the DISPC and HDMI TRM chapters.

Figure 13-7 shows wake-up generation in the display subsystem.

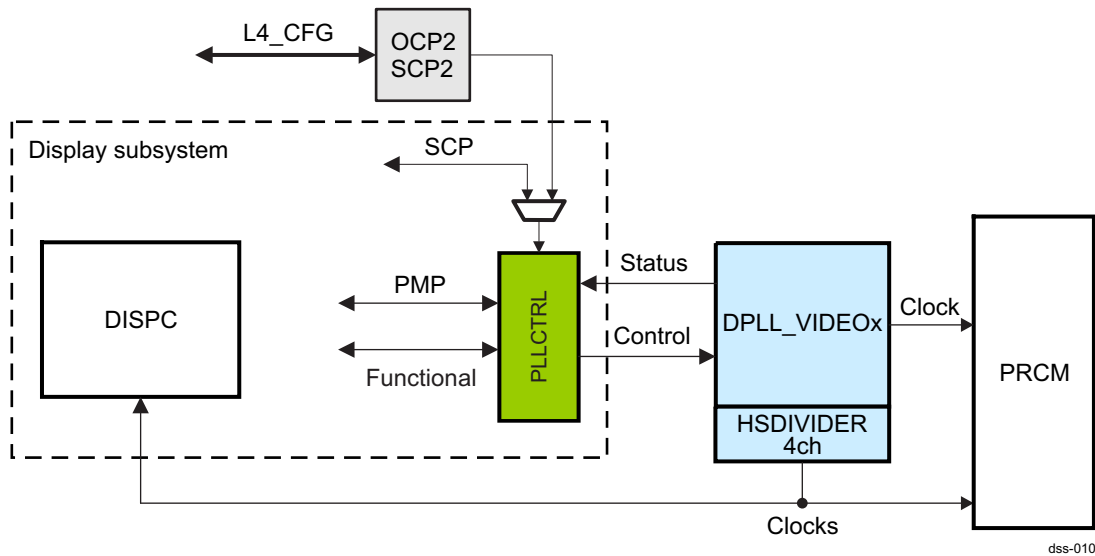

Figure 13-7. Display Subsystem Wake-Up Generation

13.1.3 Display Subsystem DPLL Controllers Functional Description

13.1.3.1 DPLL Controllers Overview

PLL controller modules are part of the display subsystem. They use the SCP and power-management port (PMP) as the primary interfaces. The SCP interface sets the configuration of the digital phase-locked loop (DPLL) and HSDIVIDER modules, primarily the various counter values. The PMP controls the power state of the DPLL and HSDIVIDER modules. [Figure 13-8](#) is an overview of a single DPLL_VIDEO controller module in the display subsystem. For more information on DPLL_HDMI control, see [Section 13.1.3.4, DPLL_HDMI](#).

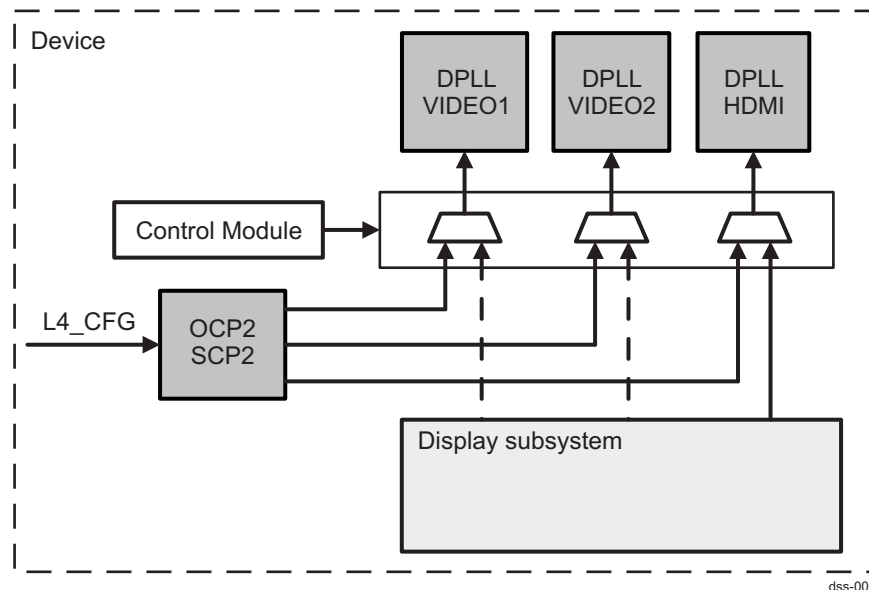

Figure 13-8. PLL Controller Overview

13.1.3.2 OCP2SCP2 Functional Description

In case DSS module is not used, DPLL_VIDEO1 and DPLL_HDMI can be still used to source other modules in the device. The OCP2SCP2 module, which serves as a L4_CFG interconnect adapter, lets user software configure the PLLCTRL for DPLL_VIDEO1 and DPLL_HDMI registers over the L4_CFG port. Figure 13-9 is an overview of the OCP2SCP2 bridge interface.

Figure 13-9. OCP2SCP2 Overview

NOTE: Selection of how DPLLs are controlled is done through registers `DSS_PLL_CONTROL[0]` `PLL_VIDEO1_DSS_CONTROL_DISABLE`, `DSS_PLL_CONTROL[1]` `PLL_VIDEO2_DSS_CONTROL_DISABLE` and `DSS_PLL_CONTROL[2]` `PLL_HDMI_DSS_CONTROL_DISABLE` of the device Control Module. For more information, see [Chapter 20, Control Module](#).

13.1.3.2.1 OCP2SCP2 Reset

13.1.3.2.1.1 Hardware Reset

The module receives an asynchronous hardware reset (L3INIT_RST) upon power-on reset (POR) at its active low PIRSTNA input. For more information on the hardware reset source, see [Section 3.5.5, Reset Domains](#), in [Chapter 3, Power, Reset, and Clock Management](#).

13.1.3.2.1.2 Software Reset

Setting the [OCP2SCP_SYSCONFIG\[1\] SOFTRESET](#) bit to 1 triggers a software reset on the OCP2SCP2 interconnect adapter. The [OCP2SCP_SYSSTATUS\[0\] RESETDONE](#) bit is used by software to monitor the status of reset completion. Hardware keeps this bit at 0 while the reset is being executed. A RESETDONE bit transition from 0 to 1 indicates the OCP2SCP2 reset is complete.

13.1.3.2.2 OCP2SCP2 Power Management

The OCP2SCP2 features idle acknowledgement protocol with the PRCM.

13.1.3.2.2.1 Idle Mode

The smart-idle mode supported by OCP2SCP2 is not wakeup capable, meaning that software should explicitly take care to wake the OCP2SCP2, setting the [OCP2SCP_SYSCONFIG\[4:3\] IDLEMODE](#) bit field to 0x1 (no-idle), once it has previously gone to an idle mode. For more information, see [Section 3.1.1.1.4, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: Software must get the OCP2SCP2 module out of IDLE state by setting the [OCP2SCP_SYSCONFIG\[4:3\] IDLEMODE](#) bit field to 0x1, once smart-idle mode has been selected ([OCP2SCP_SYSCONFIG\[4:3\] IDLEMODE](#) = 0x2).

13.1.3.2.2.2 Clock Gating

OCP2SCP2 module has a local support for an automatic clock gating based on L4_CFG interconnect activity. This feature is enabled by setting the [OCP2SCP2\[0\] AUTOIDLE](#) bit to 0x1, otherwise the module interface clock is free running. For more information, see [Section 3.6.4.1.4, Clock Domain-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

13.1.3.2.3 OCP2SCP2 Timing Registers

The timing configuration register sets various parameters controlling the timing constraints of the OCP2SCP2 module. The division ratio between the L4_CFG interconnect clock - L3INIT_L4_GICLK and the serial configuration port output clock is set through the [OCP2SCP_TIMING\[9:7\] DIVISIONRATIO](#) bit field, with a valid range of 0x1 to 0x7. The [OCP2SCP_TIMING\[6:4\] SYNC1](#) timing information is programmable in the range 0 to 7 clock cycles, and shows the acceptable delay between the enable and command availability on SCP. The value of [OCP2SCP_TIMING\[3:0\] SYNC2](#) is also programmable in the range 1 to 15 clock cycles, measured from the moment the command is available on SCP until data is accessible.

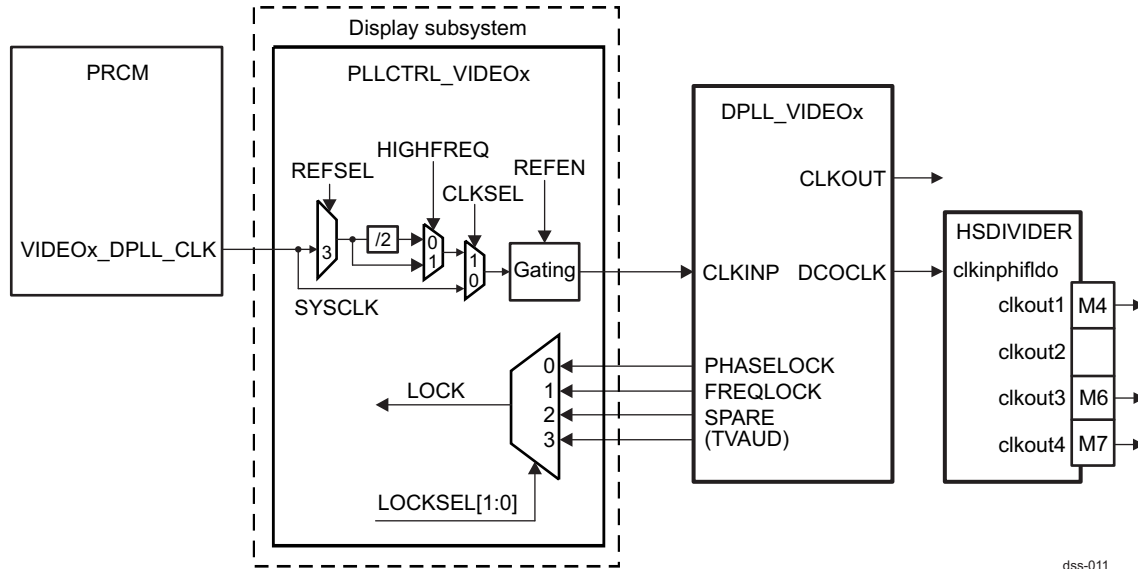

13.1.3.3 DPLL_VIDEO Functional Description

13.1.3.3.1 DPLL_VIDEO Controller Architecture

VIDEO1 PLL use type-A instances of the DPLL modules. For information regarding DPLL types, see [Chapter 3, PRCM](#).

[Figure 13-10](#) shows the internal reference diagram of a single VIDEO PLL.

Figure 13-10. VIDEO PLL Reference Diagram

Reference clock control is enabled with [PLL_CONFIGURATION2\[13\]](#) PLL_REFEN bit.

Figure 13-11 is a simplified block diagram of the DPLL_VIDEO instance used for pixel clock generation.

Figure 13-11. DPLL_VIDEO Functional Block Diagram

The input clock CLKINP goes to a pre-divider $N + 1$. The entire loop runs on the REFCLK clock after this pre-divider. The value of $N + 1$ is controlled through the [PLL_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field. The CLKINP range is 0.032MHz to 52MHz. The REFCLK range is 0.15MHz to 52MHz.

The output clock DCOCLK is synthesized by a digitally controlled oscillator (the DCO block) that automatically detects the frequency range. The DCOCLK frequency can be given with $DCOCLK = CLKINP \times 2 \times M / (N + 1)$. For that purpose the feedback multiplier M must be configured through the [PLL_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field.

The CLKOUT frequency can be given with $CLKOUT = DCOCLK / (M2 \times 2) = DCOCLK / 62$. The $M2$ divider value is hardcoded in HW at 31 (0x1F).

The DPLL provides also control for the loop bandwidth (BW) by programming the [15:14] PLL_VIDEO2_LOOPBW and [13:12] PLL_VIDEO1_LOOPBW bit-fields of the CTRL_CORE_DSS_PLL_CONTROL register in the device Control Module. This allows better control over the jitter at lower M values. [New DRA7xxP feature versus DRA75x/DRA74x]

13.1.3.3.2 DPLL_VIDEO Operations

The PLL configuration signals operate according to [Table 13-10](#), which indicates the operation when the PLLs are not locked.

Table 13-10. VIDEO PLL Operation Modes When Not Locked

PLL Operation Mode	Stop Mode Low Power ⁽¹⁾	Stop Mode Fast Relock ⁽¹⁾	Idle Bypass
Mode Description	Output clocks stopped Lowest power standby	Output clocks stopped Fastest start-up time	Selects when PLL and HSDIVIDER bypass clocks are used
PLL_CONFIGURATION2[0] PLL_IDLE	0	0	1
PLL_CONFIGURATION2[6] PLL_LOWCURRSTBY	1	0	1

⁽¹⁾ This mode must be used for better performance.

When locked, the PLL output frequency (DCOCLK) is: Input frequency $\times 2 \times M / (N + 1)$, where:

- M multiplier is programmed in the PLL_CONFIGURATION1[20:9] PLL_REGM bit field.
- N divider is programmed in the PLL_CONFIGURATION1[8:1] PLL_REGN bit field.

NOTE: When the PLL_REGM bit field is set to 1, the PLL enters a MN-Bypass mode. The DCOCLK clock output goes low and remains low until the PLL exits MN-Bypass mode (by changing the PLL_REGM bit field to a value other than 0 or 1).

13.1.3.3.3 DPLL_VIDEO Error Handling

The PLL lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The PLL_STATUS[1] PLL_LOCK status bit gives the VIDEOx PLL lock state.
- The PLL_STATUS[2] PLL_RECAL status bit informs whether the PLL must be uncalibrated.

13.1.3.3.4 DPLL_VIDEO Software Reset

The VIDEO PLL control module does not have its own software reset. It is reset by the global DSS_RST signal at PRCM module level. See Section 13.1.2.2, Display Subsystem Resets. Nevertheless, software users can monitor the reset status of the VIDEO PLL control module by reading the PLL_STATUS[0] PLLCTRL_RESET_DONE status bits.

13.1.3.3.5 DPLL_VIDEO Power Management

PLLCTRL manages only the LDO power of the DPLL and HSDIVIDER; this is done by overriding the SYSRESET signals. All other power-management signals are integrated with the display subsystem power management.

The PMP is used to manage the LDO power of the VIDEO digital phase-locked loop (DPLL) through the PLLCTRL module.

Figure 13-12 shows the power states, which can be controlled through DSI_CLK_CTRL[31:30] PLL_PWR_CMD bit field.

The PLLCTRL power status can be read through the DSI_CLK_CTRL [29:28] PLL_PWR_STATUS bit field.

- OFF power state: PLLCTRL is powered down. Internal clock is off.
- ONHSCCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL is in active state.

Figure 13-12. VIDEO PLL Power State Diagram

dss-014

13.1.3.3.6 DPLL_VIDEO HSDIVIDER Loading Operation

In manual mode (`PLL_CONTROL[0] PLL_AUTOMODE = 0`), it is possible to update the configuration values of HSDIVIDER without starting the DPLL locking sequence. Once all the configuration values have been programmed into the registers, the `PLL_GO[1] HSDIVLOAD` bit must be set. The `TENABLEDIV` output is driven high for six SCP clock periods while the `TINITZ` and `TENABLE` signals remain unchanged. The `HSDIVLOAD` bit is cleared at the end of the sequence.

The `SCPBUSY` signal is high during the sequence until the `HSDIVLOAD` bit is cleared, thus indicating that there is pending activity in the `SCPClk` domain. `SCPClk` must be kept running while this signal is asserted.

The HSDIVIDER sequence and the GO sequence cannot be performed at the same time. If one of the two sequences is running and the trigger bit of the other sequence is set, `PLLCTRL` finishes the first sequence and then immediately starts the other sequence.

13.1.3.3.7 DPLL_VIDEO Clock Sequence

The VIDEO PLL generates `DCOCLK` clock to a dedicated HSDIVIDER, which outputs three clocks (`clkout1`, `clkout3`, `clkout4`). If these three clocks are not used, the HSDIVIDER functions are not required.

In addition, a `CLKOUT` clock is also generated. It is output directly, and does not go through HSDIVIDER.

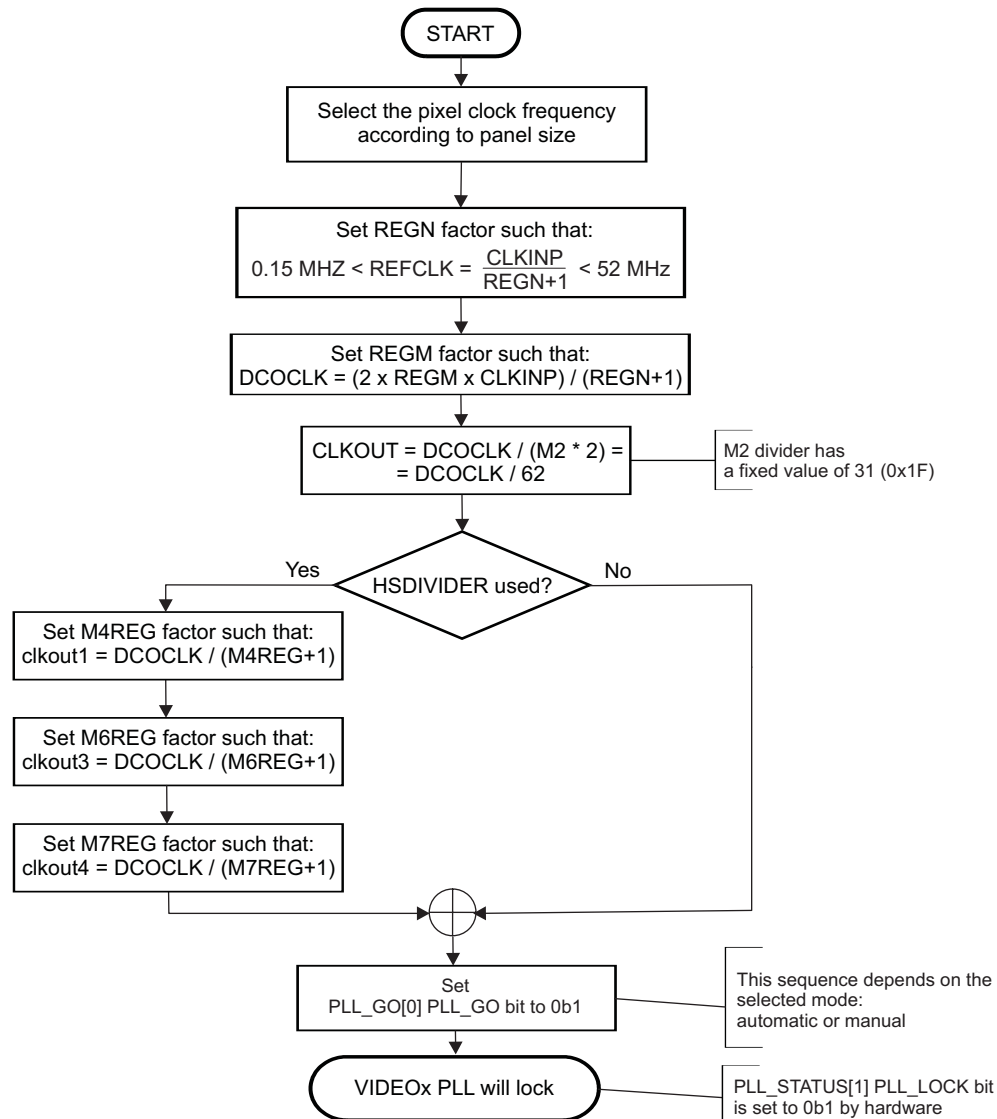

The following must be considered for [Figure 13-13](#):

- `REGM` factor is programmed by the `PLL_CONFIGURATION1[20:9] PLL_REGM` bit field. It is used to tune `DCOCLK` clock.
- `REGN` factor is programmed by the `PLL_CONFIGURATION1[8:1] PLL_REGN` bit field. It is used to tune `DCOCLK` clock.
- `M4REG` factor is programmed by the `PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV` bit field, and applies to `clkout1` of the `DPLL_VIDEO HSDIVIDER`.

- M6REG factor is programmed by the [PLL_CONFIGURATION3\[4:0\]](#) M6_CLOCK_DIV bit field, and applies to clkout3 of the DPLL_VIDEO HSDIVIDER.
- M7REG factor is programmed by the [PLL_CONFIGURATION3\[9:5\]](#) M7_CLOCK_DIV bit field, and applies to clkout4 of the DPLL_VIDEO HSDIVIDER.
- M2 divider is hardcoded in HW at 31 (0x1F), and applies to CLKOUT.

Figure 13-13 shows the programming sequence.

Figure 13-13. VIDEO PLL Programming Sequence

dss-015

NOTE:

- Most of the VIDEO PLL programming values are available for software flexibility, but it is not recommended to update the values in normal use. For the recommended VIDEO PLL values, see [Section 13.1.3.3.9, VIDEO PLL Recommended Values](#).

13.1.3.3.8 DPLL_VIDEO Go Sequence

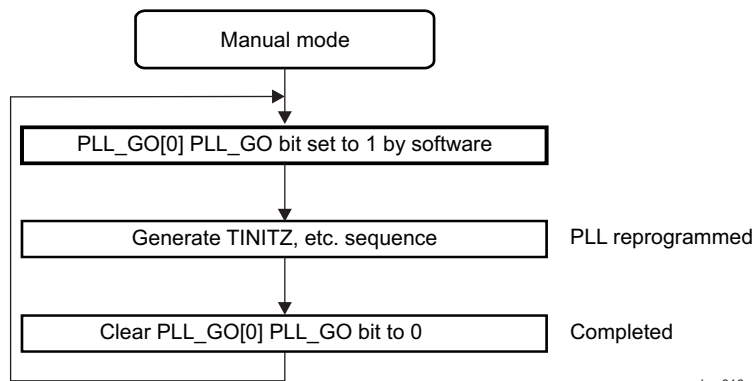

In manual mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 0), the DPLL requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPLL. The [PLL_GO\[0\]](#) PLL_GO bit is cleared to 0 at the end of the sequence.

The TENABLEDIV signal is shared with the HSDIVIDER module so that it is programmed at the same time. In this mode, software must deassert CLKINEN by setting the [PLL_CONFIGURATION2\[14\]](#) PHY_CLKINEN bit to 0 and assert HSDIVBYPASS correctly by setting the [PLL_CONFIGURATION2\[20\]](#) HSDIVBYPASS bit to 1 to prevent uncontrolled frequencies affecting the display subsystem or the other modules using DPLL_VIDEO during PLL locking. In manual mode, the shadow register is updated anyway so that valid values are present when later selecting automatic mode.

[Figure 13-14](#) shows the VIDEO PLL Go flow chart in manual mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 0).

Figure 13-14. VIDEO PLL Go Sequence (Manual Mode)

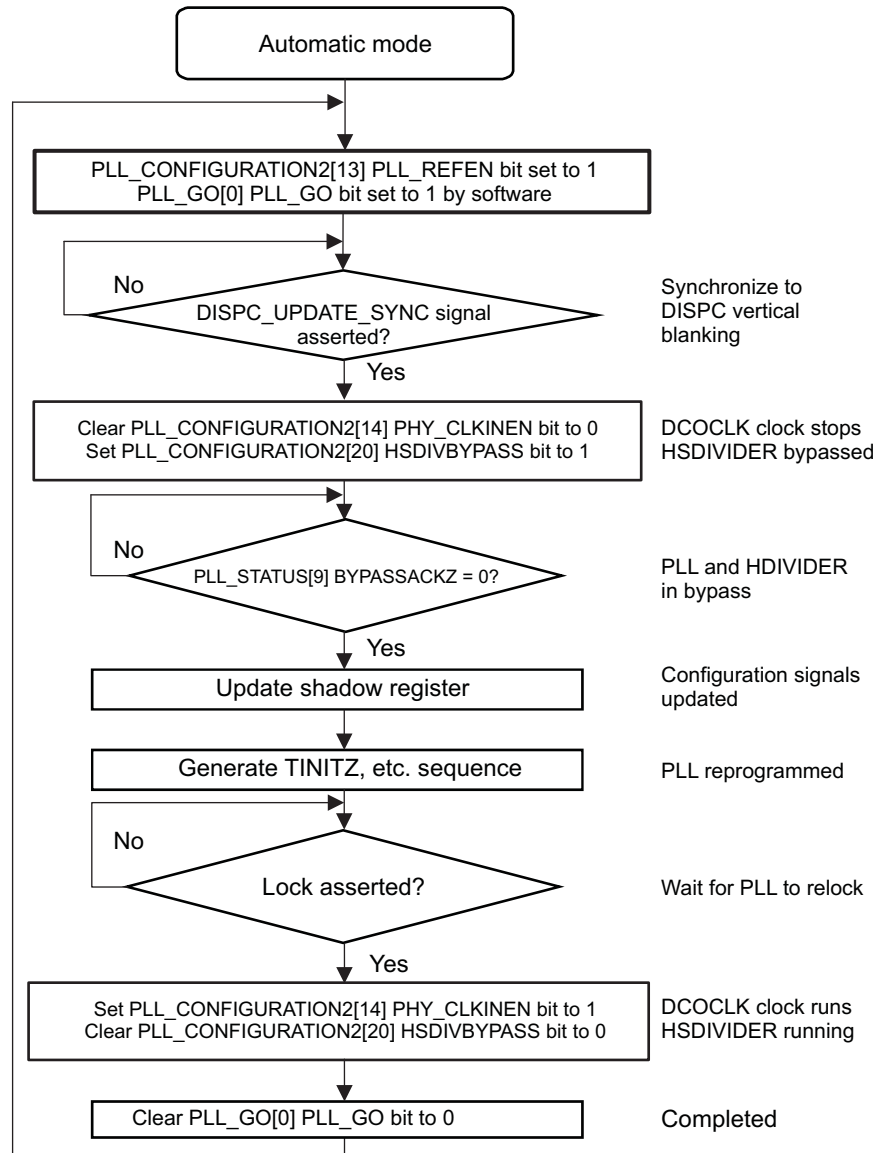

dss-016

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

In automatic mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 1), the TINITZ, TENABLE, and TENABLEDIV sequence and the update of the PLL configuration from the [PLL_CONFIGURATION2](#) register are deferred until the time of the front porch time signal sent by the DISPC module. This is intended to simplify the software to implement a configuration change (such as a frequency change to support a different link bandwidth). In this mode, CLKINEN, HSDIVBYPASS, and REFEN are automatically controlled and the register value is overridden.

[Figure 13-15](#) shows the VIDEO PLL Go flow chart in automatic mode (the [PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 1).

Figure 13-15. VIDEO PLL Go Sequence (Automatic Mode)

dss-017

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

13.1.3.3.9 DPLL_VIDEO Recommended Values

Table 13-11 shows the recommended values for PLL configuration.

Table 13-11. DPLL_VIDEO Recommended Programming Values

Field Name	Value	Description
PLL_CONTROL[4] HSDIV_SYSRESET	0	Allow power FSM to control
PLL_CONTROL[3] PLL_SYSRESET	0	Allow power FSM to control
PLL_GO[0] PLL_GO	1→0	Write 1 when PLL is to be (re)locked with new parameters. This bit is cleared by hardware when the PLL request completes.
PLL_CONFIGURATION2[20] HSDIVBYPASS	0	PLL controls HSDIVIDER bypass

Table 13-11. DPLL_VIDEO Recommended Programming Values (continued)

Field Name	Value	Description
PLL_CONFIGURATION2[16] M4_CLOCK_EN or PLL_CONFIGURATION2[23] M6_CLOCK_EN or PLL_CONFIGURATION2[25] M7_CLOCK_EN	1	If PLL/HSDIVIDER is used as the clock source
PLL_CONFIGURATION2[14] PHY_CLKINEN	1	Enable DCOCLK clock
PLL_CONFIGURATION2[13] PLL_REFEN	1	Enable PLL reference
PLL_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase lock criteria to lock the PLL
PLL_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0x0	The RECAL status/interrupt must be used to decide when to perform a PLL uncalibration. No automatic uncalibration is performed.
PLL_CONFIGURATION2[6] PLL_LOWCURRSTDBY	0/1	Set to 0 for fast PLL unlock, but higher standby current. Set to 1 for leakage level standby current, but longer unlock time.
PLL_CONFIGURATION2[5] PLL_PLLLPMODE	0	Normal operation. For smaller display sizes, it may be possible to set to 1.
PLL_CONFIGURATION2[0] PLL_IDLE	0	PLL active

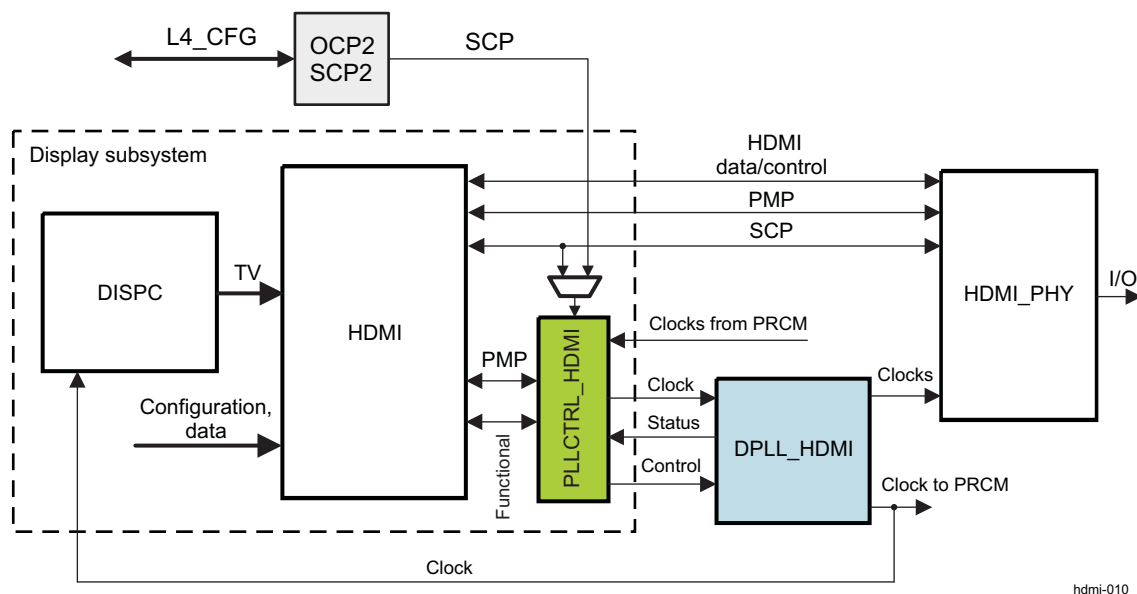

13.1.3.4 DPLL_HDMI Functional Description

13.1.3.4.1 DPLL_HDMI and PLLCTRL_HDMI Overview

The DPLL_HDMI control module (PLLCTRL_HDMI) uses the SCP and PMP as the primary interfaces to the HDMI module. The SCP interface is used to set the configuration of the digital phase-locked loop (DPLL) module, primarily the various counter values. The PMP is used to control the power state of the DPLL_HDMI module.

Figure 13-16 shows an overview of the PLLCTRL_HDMI and DPLL_HDMI modules in the display subsystem.

Figure 13-16. DPLL_HDMI and PLLCTRL_HDMI Overview

hdmi-010

NOTE: The PLLCTRL_HDMI module does not have an interface to L3_MAIN interconnect. The programmable features are managed by registers mapped into the HDMI_WP module.

13.1.3.4.2 DPLL_HDMI and PLLCTRL_HDMI Architecture

The DPLL_HDMI uses instance of the DPLL module of type B. For information regarding DPLL types, see [Chapter 3, PRCM](#).

Figure 13-17 shows the internal reference diagram of the DPLL_HDMI and PLLCTRL_HDMI interconnection in the device.

Figure 13-17. DPLL_HDMI and PLLCTRL_HDMI Reference Diagram

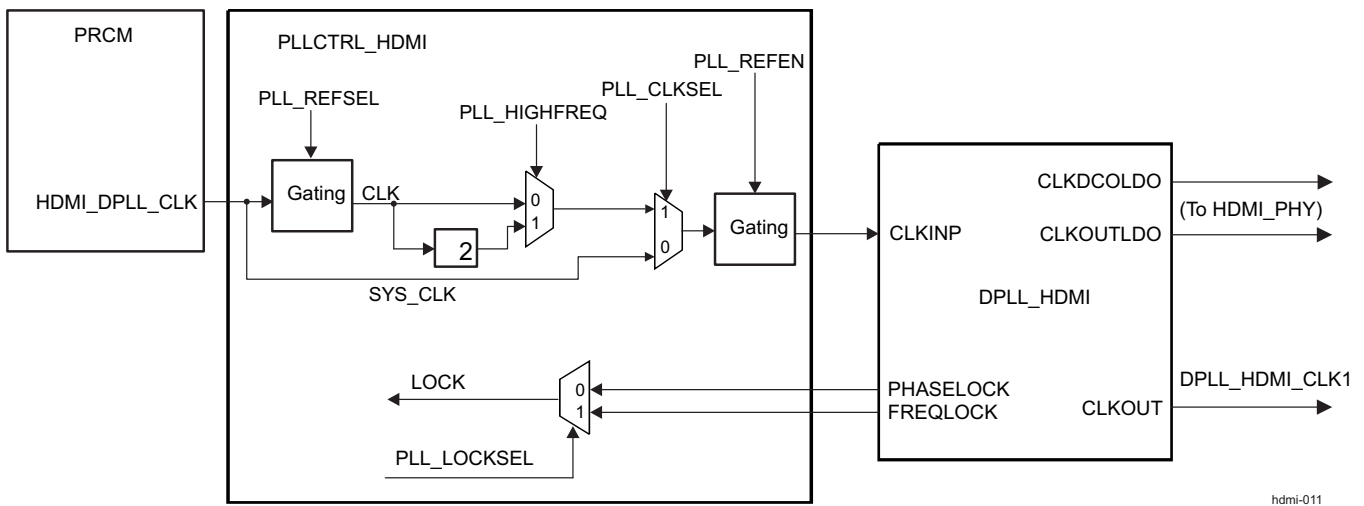

Figure 13-18 shows a simplified block diagram of the DPLL instance used for the DPLL_HDMI.

Figure 13-18. DPLL_HDMI Functional Block Diagram

The DPLL input clock CLKINP goes to a predivider $N + 1$. The entire loop runs on the REFCLK clock after this predivider. The value of $N + 1$ is controlled through the [PLLCTRL_HDMI_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field. The CLKINP range is 0.62 to 60MHz. The REFCLK range is 0.62 to 2.5MHz.

The output clock CLKDCOLDO is synthesized by a digitally controlled oscillator (DCO block). The CLKDCOLDO frequency can be given with $CLKDCOLDO = CLKINP \times M/(N + 1)$. For this purpose, the feedback multiplier M must be configured through the [PLLCTRL_HDMI_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field. The frequency range of the DCO must be selected via the [PLLCTRL_HDMI_CONFIGURATION2\[3:1\]](#) PLL_SELFREQDCO register bit-field depending on the CLKDCOLDO frequency.

The DPLL module supports fractional synthesis. That is, the frequency multiplication factor M can be programmed as fractional. This is done through the use of a sigma-delta feedback divider (M). A fractional value (REGM.f) of 18 bits is supported, thereby enabling control for better accuracy. Programming the fractional value is done by setting the [PLLCTRL_HDMI_CONFIGURATION4\[17:0\]](#) PLL_REGM_F bit field. Fractional synthesis is not supported for $M > 4093$. For integer only division the PLL_REGM_F bit-field must be set to 0x00000.

The programming of the sigma-delta feedback divider is mandatory to get the optimal jitter performance. The value is determined by $PLL_SD = \text{ceiling}((M/(N + 1)) \times CLKINP/250)$, and can be programmed into the [PLLCTRL_HDMI_CONFIGURATION3\[17:10\]](#) PLL_SD register bit-field.

The DPLL provides also control for the loop bandwidth (BW). The BW can be increased or decreased by programming the [18] PLL_HDMI_LOOPBW_INCR_DECRZ and [17:16] PLL_HDMI_LOOPBW bit-fields of the CTRL_CORE_DSS_PLL_CONTROL register in the device Control Module. This allows better control over the jitter at lower M values. *[New DRA7xxP feature versus DRA75x/DRA74x]*

13.1.3.4.3 DPLL_HDMI Operations

NOTE: The DPLL_HDMI must be configured before any transfer on the HDMI link. The HDMI module is fully operational only when the DPLL_HDMI runs and provides the TMDS clock.

The DPLL_HDMI configuration signals operate according to [Table 13-12](#), which indicates the operation when the DPLL is not locked.

Table 13-12. DPLL_HDMI Operation Modes When Not Locked

DPLL_HDMI Operation Mode	Idle Bypass
Mode Description	Selects when DPLL_HDMI Bypass Clocks Are Used
PLLCTRL_HDMI_CONFIGURATION2[0] PLL_IDLE	1

When locked, the DPLL_HDMI output frequency is:

- For CLKOUT output: $[(M+M.f)/(N+1)] \times CLKINP \times [1/M2]$
- For CLKOUTLDO output: $[(M+M.f)/(N+1)] \times CLKINP \times [1/M2]$
- For CLKDCOLDO output: $[(M+M.f)/(N+1)] \times CLKINP$

CLKINP is the input frequency in MHz. The divider and multiplier values in the above formulas can be set through the following registers:

- M frequency multiplier is programmed in the [PLLCTRL_HDMI_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field.
- Fractional M (if fractional M divider is required by the use case) is programmed in the [PLLCTRL_HDMI_CONFIGURATION4\[17:0\]](#) PLL_REGM_F bit field
- N divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field.
- M2 divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION4\[24:18\]](#) PLL_REGM2 bit field.
- SD divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION3\[17:10\]](#) PLL_SD bit field.

NOTE: When the PLL_REGM bit field is set to 1, the DPLL enters a MN-Bypass mode. This is a low-power mode, where the DPLL gates its internal clocks and powers down the analog blocks. The CLKDCOLDO and CLKOUTLDO clock outputs go low and remain like that until the DPLL exits MN-Bypass mode (by changing the PLL_REGM bit-field to a value other than 0 or 1).

NOTE: The DPLL_HDMI must be configured before any data transfer to HDMI_PHY.

13.1.3.4.4 DPLL_HDMI Register Access

The configuration registers are accessed through the HDMI module register spaces using the SCP interface. This includes all the configuration signals and returning status signals.

CAUTION

All writes must be 32-bit operations because the SCP interface always transfers 32 bits; 16- or 8-bit operations can lead to unpredictable errors.

13.1.3.4.5 DPLL_HDMI Error Handling

The DPLL_HDMI lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The [PLLCTRL_HDMI_STATUS\[1\]](#) PLL_LOCK bit gives the DPLL_HDMI lock state.
- The [PLLCTRL_HDMI_STATUS\[2\]](#) PLL_RECAL bit informs whether the PLL must be recalibrated.

These signals can also generate interrupts at the HDMI module level.

The PLL reference loss status signal can also be monitored:

- The [PLLCTRL_HDMI_STATUS\[3\]](#) PLL_LOSSREF bit informs whether the DPLL_HDMI has lost the reference clock.

13.1.3.4.6 DPLL_HDMI Software Reset

The PLLCTRL_HDMI module does not have its own software reset. It is reset by the HDMI module. Nevertheless, the reset status of the PLLCTRL_HDMI module can be monitored by reading the [PLLCTRL_HDMI_STATUS\[0\]](#) PLLCTRL_RESET_DONE bit.

13.1.3.4.7 DPLL_HDMI Power Management

The PLLCTRL_HDMI manages only the LDO power of the DPLL_HDMI. This is done by overriding the SYSRESET signal. All other power-management signals are integrated with the display subsystem power management.

The PMP is used to manage the LDO power of the HDMI_DPLL through the PLLCTRL_HDMI module.

[Figure 13-19](#) shows the power states, which can be controlled through [HDMI_WP_PWR_CTRL\[3:2\]](#) PLL_PWR_CMD bit field.

The PLLCTRL_HDMI power status can be read through the [HDMI_WP_PWR_CTRL\[1:0\]](#) PLL_PWR_STATUS bit field.

Figure 13-19. PLLCTRL_HDMI Power State Diagram

hdmi-048

- OFF power state: PLLCTRL_HDMI is powered down. Internal clock is off.
- ONHCLK: Power command received
- ONDIV: Clock dividers set.
- ONALL: PLLCTRL_HDMI is in active state.

13.1.3.4.8 DPLL_HDMI Lock Sequence

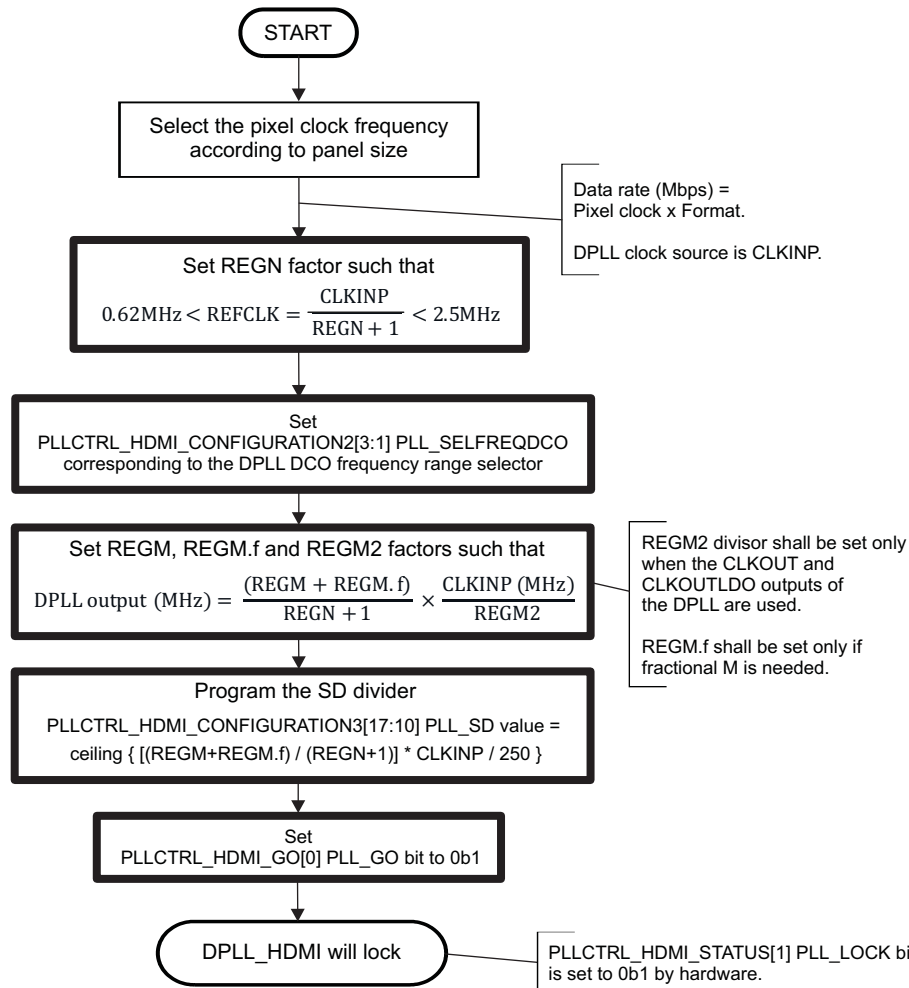

The DPLL_HDMI generates the clocks to the HDMI_PHY module and the DPLL_HDMI_CLK1 clock used by the DISPC and various system modules.

The DPLL_HDMI factors must be calculated based on the required input and output frequencies, keeping the DPLL_HDMI internal reference frequency in the appropriate range:

- REGM factor is programmed in the [PLLCTRL_HDMI_CONFIGURATION1](#)[20:9] PLL_REGM bit field.
- REGM.f factor (if fractional M divider is required by the use case) is programmed in the [PLLCTRL_HDMI_CONFIGURATION4](#)[17:0] PLL_REGM_F bit field.
- REGN factor is programmed in the [PLLCTRL_HDMI_CONFIGURATION1](#)[8:1] PLL_REGN bit field.
- REGM2 factor is programmed in the [PLLCTRL_HDMI_CONFIGURATION4](#)[24:18] PLL_REGM2 bit field.
- SD divider is programmed in the [PLLCTRL_HDMI_CONFIGURATION3](#)[17:10] PLL_SD bit field.

Figure 13-20 shows the programming sequence.

Figure 13-20. DPLL_HDMI Programming Sequence

hdmi-014

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

Table 13-13 summarizes the registers for the DPLL_HDMI programming sequence.

Table 13-13. DPLL_HDMI Register Call Summary for HDMI PLL Programming Sequence

Register Name	Register Name	Register Name	Register Name	Register Name
PLLCTRL_HDMI_CONFIGURATION2	PLLCTRL_HDMI_GO	PLLCTRL_HDMI_STATUS	PLLCTRL_HDMI_CONFIGURATION3	PLLCTRL_HDMI_CONFIGURATION4

- NOTE:** The following should be considered for the programming sequence in [Figure 13-20](#):
- The equation for the DPPLL output applies to both CLKDCOLDO and CLKOUTLDO outputs of the DPPLL_HDMI. The REGM2 divisor value must be considered only in case the CLKOUTLDO frequency needs to be calculated. Programming of REGM.f is needed only if fractional M divider is required by the use case.
 - The DPPLL_HDMI_CLK1 clock is sourced from the CLKDCOLDO output of the DPPLL_HDMI:
 - The DPPLL_HDMI_CLK1 frequency must be a multiple of the PCLK frequency (for proper settings of the PCD and LCD factors in the DISPC).
 - The DPPLL_HDMI_CLK1 frequency must be lower than 186 MHz.
 - The [PLLCTRL_HDMI_CONFIGURATION2\[3:1\]](#) PLL_SELFREQDCO register bit field should be programmed depending on the value of CLKDCOLDO = CLKINP × M/(N + 1). See [Section 13.1.3.4.3, DPPLL_HDMI Operations](#).
 - Programming of other DPPLL_HDMI parameters is available for software flexibility, but it is not recommended to update their values in normal use. For the recommended DPPLL_HDMI values, see [Section 13.1.3.4.10, DPPLL_HDMI Recommended Values](#).

13.1.3.4.9 DPPLL_HDMI Go Sequence

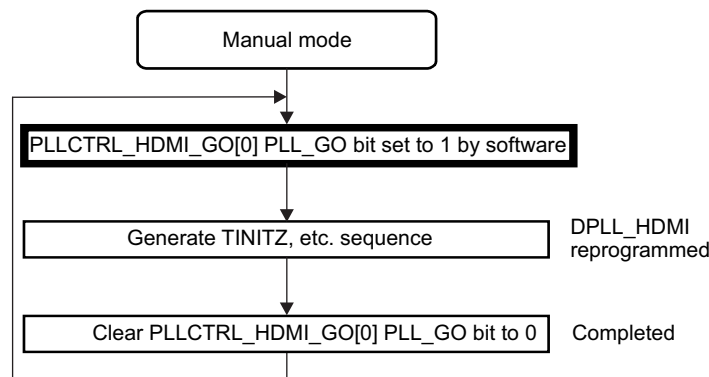

The DPPLL_HDMI controller works in manual mode. In this mode the DPPLL_HDMI requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DPPLL_HDMI. The [PLLCTRL_HDMI_GO\[0\]](#) PLL_GO bit is cleared to 0 at the end of the sequence.

In this mode, software must deassert CLKINEN by resetting the [PLLCTRL_HDMI_CONFIGURATION2\[14\]](#) PHY_CLKINEN bit to 0 to prevent uncontrolled frequencies affecting HDMI_PHY and the display subsystem during DPPLL_HDMI locking.

[Figure 13-21](#) shows the PLLCTRL HDMI GO flow chart in manual mode.

Figure 13-21. DPPLL_HDMI GO Sequence (Manual Mode)

hdmi-015

NOTE: All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

13.1.3.4.10 DPPLL_HDMI Recommended Values

[Table 13-14](#) lists the main DPPLL_HDMI and PLLCTRL_HDMI recommended values.

Table 13-14. DPLL_HDMI Recommended Programming Values

Field Name	Value	Description
PLLCTRL_HDMI_GO [0] PLL_GO	1 - 0	Write 1 when DPLL_HDMI is to be (re)locked with new parameters. This bit is cleared to 0 by hardware when the DPLL_HDMI request completes.
PLLCTRL_HDMI_CONFIGURATION1 [20:9] PLL_REGM	See ⁽¹⁾	DPLL_HDMI feedback clock divider.
PLLCTRL_HDMI_CONFIGURATION4 [17:0] PLL_REGM_F	See ⁽¹⁾	Fractional part of the DPLL_HDMI feedback clock divider. Must be kept at 0, if integer divider only will be used.
PLLCTRL_HDMI_CONFIGURATION1 [8:1] PLL_REGN	See ⁽¹⁾	DPLL_HDMI reference clock divider.
PLLCTRL_HDMI_CONFIGURATION2 [15] BYPASSEN	0	When this bit is 0, the CLKOUT clock depends on the DPLL_HDMI configuration (DPLL locked). For small displays, it may be possible to use the functional clock, in which case this bit must be set to 1. When 1, the internal DPLL_HDMI configuration path is bypassed, and CLKINP is sent on the CLKOUT output.
PLLCTRL_HDMI_CONFIGURATION2 [14] PHY_CLKINEN	1	Enable DPLL_HDMI clock output to HDMI_PHY.
PLLCTRL_HDMI_CONFIGURATION2 [13] PLL_REFEN	1	Enable the DPLL_HDMI reference clock.
PLLCTRL_HDMI_CONFIGURATION2 [10:9] PLL_LOCKSEL	0x0	Phase-lock criteria to lock the DPLL_HDMI.
PLLCTRL_HDMI_CONFIGURATION2 [8] PLL_DRIFTGUARDEN	0	The RECAL status/interrupt must be used to decide when to perform a DPLL_HDMI uncalibration. No automatic uncalibration is performed.
PLLCTRL_HDMI_CONFIGURATION2 [3:1] PLL_SELFREQDCO	See ⁽¹⁾	Must be programmed based on the DPLL_HDMI lock frequency.
PLLCTRL_HDMI_CONFIGURATION2 [0] PLL_IDLE	0	DPLL_HDMI active.
PLLCTRL_HDMI_CONFIGURATION3 [17:10] PLL_SD	See ⁽¹⁾	Sigma-delta divider = ceiling { [PLL_REGM / (PLL_REGN+1)] * CLKINP(MHz) / 250 }

⁽¹⁾ The value of the bit field must be set according to the desired clock frequency.

13.1.4 Display Subsystem Programming Guide

This section provides recommended steps for initializing the DSS module.

Table 13-15. DSS Initialization Sequence

Step	Register / Bit Field / Chapter	Value
Enable DSS clock domain		
Configure DPLL_PER and associated HS12 divider, according to the desired DSS_GFCLK frequency	Refer to Chapter 3 , section <i>DPLL_PER Description</i>	-
Enable DES_HDCP clock	Set CTRL_CORE_CONTROL_IO_2[0] DSS_DESHDCP_CLKEN register bit; Refer to Section 20.5 , <i>Control Module Register Manual</i>	0x1
Set SW wake-up transition for DSS clock domain	Set CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL register bitfield; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x2
Enable (ungate) DSS_GFCLK clock	Set CM_DSS_DSS_CLKCTRL[8] OPTFCLKEN_DSSCLK register bit; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x1
Enable DSS clocks	Set CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE register bitfield; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x2
Wait for DSS idle status (functional or in idle mode)	Read CM_DSS_DSS_CLKCTRL[17:16] IDLEST register bit-field; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x0 or 0x2
Make DSS DPLLs accessible via DSS address space		
Make VIDEO1 and HDMI DPLLs accessible via DSS	Clear the following bits in CTRL_CORE_DSS_PLL_CONTROL register: [2] PLL_HDMI_DSS_CONTROL_DISABLE bit; [1] PLL_VIDEO2_DSS_CONTROL_DISABLE bit; [0] PLL_VIDEO1_DSS_CONTROL_DISABLE bit; Refer to Section 20.5 , <i>Control Module Register Manual</i>	0x0
Enable DSS internal SCP interface		
Enable DSS internal SCP interface for VIDEO1 register configuration	Set DSI_CLK_CTRL [14] CIO_CLK_ICG register bit	0x1
Configure DSS internal SCP interface for HDMI DPLL register configuration	Set HDMI_WP_CLK [10:8] SCP_PWR_DIV register bit-field	0x-
Configure DSS DPLLs		
Enable (ungate) VIDEO1 and HDMI DPLLs source clocks	Set the following bits in CM_DSS_DSS_CLKCTRL register: [13] OPTFCLKEN_VIDEO2_CLK bit; [12] OPTFCLKEN_VIDEO1_CLK bit; [10] OPTFCLKEN_HDMI_CLK bit; Refer to Section 3.12 , <i>PRCM Register Manual</i>	0x1
Proceed with VIDEO1 and HDMI DPLLs configuration	Refer to Section 13.1.3 , <i>Display Subsystem DPLL Controllers Functional Description</i>	-

13.1.5.4.2 DPLL_VIDEO Register Description**Table 13-37. PLL_CONTROL**

Address Offset	0x0000 0000	Instance	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4 DPLL_VIDEO2_MAIN_L3 DPLL_VIDEO2_CFG_L4
Physical Address	0x5800 4300 0x4A0A 4000 0x5800 9300 0x4A0A 5000		
Description	This register controls the PLL reset/power and modes		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																											HSDIV_SYSRESET	PLL_SYSRESET	PLL_HALTMODE	PLL_GATEMODE	PLL_AUTOMODE

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Reads as zero.	R	0x0000000
4	HSDIV_SYSRESET	Force HSDIVIDER SYSRESETN. Reserved when DBGSSV is 1. 0x0: HSDIVIDER SYSRESET forced active 0x1: HSDIVIDER SYSRESET controlled by power FSM	RW	1
3	PLL_SYSRESET	Force DPLL SYSRESETN. Reserved when DBGSSV is 1. 0x0: PLL SYSRESET forced active 0x1: PLL SYSRESET controlled by power FSM	RW	1
2	PLL_HALTMODE	Allow PLL to be halted if no activity. Reserved when PLLCTRL_AUTO is 0. 0x0: PLL will not be halted 0x1: PLL will be halted based on activity	RW	0
1	PLL_GATEMODE	Allow PLL clock gating for power saving. Reserved when PLLCTRL_AUTO is 0. 0x0: PHY clock on 0x1: Reserved	RW	0

Bits	Field Name	Description	Type	Reset
0	PLL_AUTOMODE	Automatic update mode. If this bit is set then the configuration updates will be synchronized to DISPCUpdateSync. If this bit is clear configuration updates will be done immediately. Reserved when PLLCTRL_AUTO is 0. 0x0: Manual mode 0x1: Automatic mode	RW	0

Bits	Field Name	Description	Type	Reset
31:17	RESERVED	Reads as zero.	R	0x0000
16	PLL_TICOPWDN	PLL TICOPWDN status. Read 0x1: Internal oscillator power down Read 0x0: Internal oscillator power up	R	0
15	PLL_LDOPWDN	PLL LDOPWDN status. Read 0x1: PLL's internal LDO is power down Read 0x0: PLL's internal LDO is power up	R	0
14:13	BYPASSACKZ	State of bypass mode on PHY and HSDIVIDER. The status is shown separately for each source. Read 0x1: PLL outputs are still being used by the PHY or HSDIVIDER. Read 0x0: PHY or HSDIVIDER has switched to using the bypass clocks.	R	0x0

Bits	Field Name	Description	Type	Reset
12	SSC_EN_ACK	Spread Spectrum Clocking acknowledge Read 0x1: Spread Spectrum Clocking active Read 0x0: Spread Spectrum Clocking inactive Note: SSC feature is not supported.	R	0
11	M7_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x0: M7 clock inactive Read 0x1: M7 clock active	R	0x0
10	M6_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x1: M6 clock active Read 0x0: M6 clock inactive	R	0
9	BYPASSACKZ_MERGED	Merged state of bypass mode on PHY and HSDIVIDER Read 0x1: PLL outputs are still being used by the PHY or HSDIVIDER Read 0x0: PHY and HSDIVIDER have switched to using the bypass clocks.	R	0
8	RESERVED	Reads as zero.	R	0x0000
7	M4_CLOCK_ACK	Acknowledge for enable of sub-system clock Verify the status before selecting this source in the sub-system clock mux Read 0x1: M4 clock active Read 0x0: M4 clock inactive	R	0
6	PLL_BYPASS	PLL Bypass status Read 0x1: PLL bypass Read 0x0: PLL not bypassing	R	0
5	PLL_HIGHJITTER	PLL High Jitter status Read 0x1: PLL in high jitter condition: Phase error > 24% Read 0x0: PLL in normal jitter condition	R	0
4	RESERVED	Read returns zero.	R	0
3	PLL_LOSSREF	PLL Reference Loss status Read 0x1: Reference input inactive Read 0x0: Reference input active	R	0
2	PLL_RECAL	PLL re-calibration status If this bit is active, the PLL needs to be re-calibrated Read 0x1: Recalibration is required Read 0x0: Recalibration is not required	R	0
1	PLL_LOCK	PLL Lock status See the programming guide for the use of this bit Read 0x1: PLL is locked Read 0x0: PLL is not locked	R	0
0	PLLCTRL_RESET_DONE	PLLCTRL reset done status Read 0x1: Reset has completed Read 0x0: Reset is in progress	R	0

Address Offset	0x0000 000C	Instance	DPLL_VIDEO1_MAIN_L3 DPLL_VIDEO1_CFG_L4 DPLL_VIDEO2_MAIN_L3 DPLL_VIDEO2_CFG_L4
Physical Address	0x5800 430C 0x4A0A 400C 0x5800 930C 0x4A0A 500C		
Description	This register contains the latched PLL and HSDIVDER configuration bits		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED	RESERVED					M4_CLOCK_DIV			PLL_REGM								PLL_REGN					RESERVED									

Bits	Field Name	Description	Type	Reset
31	RESERVED	Read returns zero.	R	0
30:26	RESERVED	Reserved	R	0x0000
25:21	M4_CLOCK_DIV	Divider value for clock source M4REG Divider value = M4_CLOCK_DIV + 1	RW	0x00
20:9	PLL_REGM	M Divider for PLL. Valid values range is from 1 to 2047. Values 2048 and above are reserved and must not be used. When the PLL_REGM bit field is set to 1, the PLL enters a MN-Bypass mode. The DCOCLK clock output goes low and remains low until the PLL exits MN-Bypass mode (by changing the PLL_REGM bit field to a value other than 0 or 1).	RW	0x000
8:1	PLL_REGN	N Divider for PLL (Reference). Divider value = PLL_REGN+1. Valid values range is from 0 to 127. Values 128 and above are reserved and must not be used.	RW	0x00
0	RESERVED	Read returns zero.	R	0

Bits	Field Name	Description	Type	Reset
31:26	RESERVED	Read as zero.	R	0x00
25	M7_CLOCK_EN	Enable for M7 clock source 0x0: M7 clock divider is disabled 0x1: M7 clock divider is enabled	RW	0x0
24	RESERVED	Read returns zero.	R	0
23	M6_CLOCK_EN	Enable for M6 clock source 0x0: M6 clock divider is disabled 0x1: M6 clock divider is enabled	RW	0
22:21	REFSEL	Selects the reference clock with optional divide by 2 0x0: Reserved 0x1: Reserved 0x3: Select SYSCLK reference 0x2: Reserved	RW	0x0
20	HSDIVBYPASS	Forces HSDIVIDER to bypass mode 0x0: HSDIVIDER in normal operation. Bypass controlled by PLL. 0x1: HSDIVIDER forced to bypass mode.	RW	0
19	RESERVED	Read returns zero.	R	0
18	RESERVED	Read returns zero.	R	0
17	RESERVED	Read returns zero	R	0
16	M4_CLOCK_EN	Enable for M4 clock source 0x0: Sub-system clock divider is disabled 0x1: Sub-system clock divider is enabled	RW	0
15	BYPASSEN	Selects sub-system functional clock as PHY clock source 0x0: PLL controls the PHY clock source: PLL DCO if PLL is locked Sub-system functional clock if not locked 0x1: Force sub-system functional clock to be used as the PHY clock source	RW	0
14	PHY_CLKINEN	PHY clock control 0x0: PHY clock is disabled 0x1: PHY clock is enabled	RW	0

Bits	Field Name	Description	Type	Reset
13	PLL_REFEN	PLL reference clock control 0x0: PLL reference clock disabled 0x1: PLL reference clock enabled	RW	1
12	PLL_HIGHFREQ	Enables a division of pixel clock by 2 before input to the PLL Required for pixel clock frequencies above 32 MHz (21 MHz if N = 0) 0x0: Pixel clock is not divided 0x1: Pixel clock is divided by 2	RW	0
11	PLL_CLKSEL	Reference clock selection 0x0: Selects SYSCLK as PLL reference clock 0x1: Selects Pixel Clock (PCLK) as PLL reference clock	RW	0
10:9	PLL_LOCKSEL	Selects the lock criteria for the PLL 0x0: Phase Lock 0x1: Frequency Lock 0x2: Spare	RW	0x0
8	PLL_DRIFTGUARDEN	PLL DRIFTGUARDEN 0x0: Only RECAL flag is asserted in case of temperature drift. The programmer should take appropriate action. 0x1: Temperature drift will initiate automatic recalibration. RECAL flag will be asserted while this is taking place.	RW	0
7	RESERVED		R	0
6	PLL_LOWCURRSTBY	PLL LOW CURRENT STANDBY 0x0: LOWCURRSTBY is not selected 0x1: LOWCURRSTBY is selected	RW	0
5	PLL_PLLLPMODE	Select the power / performance of the PLL 0x0: Full performance, minimized jitter 0x1: Reduced power, increased jitter	RW	0
4	RESERVED	Reads as zero.	R	0
3:1	RESERVED	Reserved	R	0
0	PLL_IDLE	PLL IDLE: 0x0: IDLE is not selected 0x1: IDLE is selected	RW	0

Bits	Field Name	Description	Type	Reset
31:23	RESERVED	Reserved.	R	0x0
22:21	REFSEL	Selects the reference clock with optional divide by 2 0x0: Select PCLK reference 0x1: Select REF1 reference 0x3: Select SYSCLK reference 0x2: Select REF2 Reference	RW	0x0
20	HSDIVBYPASS	Forces HSDIVIDER to bypass mode 0x0: HSDIVIDER in normal operation. Bypass controlled by DPLL_HDMI 0x1: HSDIVIDER forced to bypass mode.	RW	0x0
19:16	RESERVED	Reserved.	R	0x0
15	BYPASSEN	Selects sub-system functional clock as PHY clock source 0x0: DPLL_HDMI controls the PHY clock source: PLL DCO if DPLL_HDMI is locked Sub-system functional clock if not locked 0x1: Force sub-system functional clock to be used as the PHY clock source	RW	0x0
14	PHY_CLKINEN	PHY clock control 0x0: PHY clock is disabled 0x1: PHY clock is enabled	RW	0x0
13	PLL_REFEN	DPLL_HDMI reference clock control 0x0: DPLL_HDMI reference clock disabled 0x1: DPLL_HDMI reference clock enabled	RW	0x1
12	PLL_HIGHFREQ	Enables a division of pixel clock by 2 before input to the DPLL_HDMI Required for pixel clock frequencies above 32 MHz (21 MHz if N = 0) 0x0: Pixel clock is not divided 0x1: Pixel clock is divided by 2	RW	0x0
11	PLL_CLKSEL	Reference clock selection 0x0: Selects SYSCLK as DPLL_HDMI reference clock 0x1: Selects Pixel Clock (PCLK) as DPLL_HDMI reference clock	RW	0x0
10:9	PLL_LOCKSEL	Selects the lock criteria for the DPLL_HDMI 0x0: Phase Lock 0x1: Frequency Lock 0x2: Spare	RW	0x0
8	PLL_DRIFTGUARDEN	DPLL_HDMI DRIFTGUARDEN 0x0: Only RECAL flag is asserted in case of temperature drift. The programmer should take appropriate action. 0x1: Temperature drift will initiate automatic recalibration. RECAL flag will be asserted while this is taking place.	RW	0x0
7	RESERVED	Reserved.	R	0x0
6	PLL_LOWCURRSTBY	DPLL_HDMI LOW CURRENT STANDBY 0x0: LOWCURRSTBY is not selected 0x1: LOWCURRSTBY is selected	RW	0x0
5	PLL_PLLLPMODE	Select the power / performance of the DPLL_HDMI 0x0: Full performance, minimised jitter 0x1: Reduced power, increased jitter	RW	0x0
4	RESERVED	Reads as zero.	R	0x0

Bits	Field Name	Description	Type	Reset
3:1	PLL_SELFREQDCO	DCO frequency range selector for DPLL_HDMI 0x2: Set if DCO frequency is between 750MHz and 1500MHz 0x4: Set if DCO frequency is between 1250MHz and 2500MHz Others: Reserved	RW	0x4
0	PLL_IDLE	DPLL_HDMI IDLE: 0x0: IDLE is not selected 0x1: IDLE is selected	RW	0x0

RESERVED																SCP_PWR_DIV		RESERVED													

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x00 0000
10:8	SCP_PWR_DIV	Defines the divisor value to be used for the generation of the SCP_PWR clock (up to 66.5MHz) from the input interface clock (up to 266MHz). 0x0 means gated 0x1 means free-running The valid values are from 0 to 7. In case of interface access to register through SCP interface, if the SCP_PWR clock is gated, the HW automatically generates the clock by using a divisor of 7 and updates the bit-field with the value 7. It is then software responsibility to change the value at any time in order to improve SCP latency when accessing the registers in the HDMI_PHY and PLLCTRL_HDMI by reducing the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
7:0	RESERVED		R	0x0

13.2 Display Controller

13.2.1 DISPC Overview

Figure 13-22 shows a block diagram of the display controller (DISPC) within the display subsystem.

Figure 13-22. DISPC Overview

dispc-064

The DISPC includes the following main features:

- Five pipelines for processing:
 - One Graphics (GFX):
 - Pixel formats: ARGB16-4444, xRGB12-4444, RGBA16-4444, RGBx12-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, xRGB24-8888, RGBx24-8888, BGRA32-8888, RGB24-888 (packed), where x means that the corresponding bits in the container are not used
 - Premultiplied ARGB and RGBA formats
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the most significant bits [MSBs] or adding 0s)
 - Support for antiflicker on RGB pixel formats using 3-tap filter
 - Three Video pipelines (VID1, VID2, and VID3):
 - Pixel formats: ARGB16-4444, xRGB12-4444, RGBx12-4444, RGBA12-3333, RGBA16-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888,

- RGBx32-8888, RGB24-888, BGRA32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21 (where x means that the corresponding bits in the container are not used)
- Premultiplied ARGB and RGBA formats
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
 - Maximum input width of 1920 pixels
 - No limitation on the input height
 - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
 - Alpha blending factor is rescaled like the R, G, and B color components.
 - Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB32-8888. Images in YUV4:2:2 format with 90- or 270-degree rotation are preprocessed to YUV4:4:4 before the scaler, by duplicating the missing Chroma.
 - Programmable VC-1 range mapping
 - One write-back (WB) pipeline: Allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame
 - Programmable color space conversion RGB24 into YUV4:4:4 or to YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21 using programmable poly-phase filter
 - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21
 - Selection of the color depth reduction from RGB24 to RGB16
 - Programmable poly-phase filter:
 - Independent horizontal and vertical resampling: Upsampling (up to x8) and downsampling (down to 1/4)
 - Maximum input width of 1920 pixels
 - No limitation on the input height
 - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, and YUV4:2:0-NV21
 - Alpha blending factor is rescaled like the R, G, and B color components.
 - Selection of the source of the data:
 - Overlay output:
 - Primary LCD output
 - Secondary LCD output
 - Third LCD output
 - TV output
 - Pipelines:
 - Graphic
 - Video 1
 - Video 2
 - Video 3
 - Three LCD outputs: primary (LCD1), secondary (LCD2), and tertiary (LCD3):
 - Input pixel format: ARGB32-8888

- Output pixel format: RGB24-888 and YUV4:2:2 (YUV4:2:2 only available when BT mode output is enabled)
- Overlay of graphic and video for one to four pipelines
- Source and destination transparency color key
- Global and pixel alpha blending (up to 8-bit blending factor)
- Z-order programmable (full flexibility)
- Displays supported:
 - Active matrix color: 12-, 16-, 18-, and 24-bit panel interface support (replicated or dithered encoded pixel values)
- Independent programmable timing generators for LCD1, LCD2, and LCD3 to support:

Using DPI1 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI2 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps
Using DPI3 interface	SXGA VESA timing @ 60 fps, 1080i/720p @ 60 fps CEA-861-D, UXGA @ 60 fps

- Configurable LCD output mode: progressive or interlace mode
- Multiple-cycle output format on 8-, 9-, 12-, and 16-bit interface time division multiplexing (TDM)
- One TV output:
 - Input pixel format: ARGB40-10.10.10.10
 - Output pixel format: ARGB40-10.10.10.10
 - Overlay of graphic and video for one to four pipelines
 - Source and destination transparency color key
 - Global and pixel alpha blending (up to 10-bit blending factor)
 - Z-order programmable (full flexibility)
 - Slave mode support (no master mode support) with synchronization signals provided by HDMI TX:
 - HSYNC (horizontal synchronization signal)
 - VSYNC (vertical synchronization signal)
 - RE (data request signal)
 - FID (field ID: even and odd field information)
 - RGB30-10.10.10 data bus output for connection to HDMI TX and extended to 36 by duplication of the MSBs
 - HD-1080p, HD-1080i, HD-720p, SD-480p, SD-576p, SD-576i, and SD-480i using HDMI
 - HDMI deep color mode support, 30-bit data output to HDMI encoder
 - Pixel duplication capability (from one pixel clock cycle up to eight cycles)
- Panel support with MIPI DPI protocol:
 - 12-, 16-, 18-, and 24-bit active matrix panel interface support (replicated or dithered encoded pixel values)
- Common:
 - Rotation 0, 90, 180, and 270 degrees using DMM-TILER
 - Synchronized buffer update
 - Hardware cursor (using the graphics pipeline or one of the video pipelines)
 - Independent gamma curve support on LCDs outputs and TV output
 - Multiple-buffer support
 - Mirroring/flip-flop support (using DMM-TILER)
 - Programmable color phase rotation (CPR)
 - Alpha blending support:

- Embedded pixel factor (ARGB and RGBA)
- Global alpha
- DMA (internal to the DISPC):
 - Support for accessing tiled structure through the TILER inside the dynamic memory management (DMM)
 - Support for accessing nontiled structure through the TILER or directly
 - Support for rotation, flip-flop, and mirroring through the TILER inside the DMM
 - Support for memory fragmentation through the TILER inside the DMM
 - Integrated shared buffers between DMA engine and pipelines
 - Programmable buffer thresholds
 - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced:
 - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
 - DMA buffer hand-check in stall mode
 - Arbitration between high and low priority (GFX, VID1, VID2, VID3, and WB pipelines)
- Power modes:
 - Low-power saving modes
 - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
 - Merge capability of the DMA buffers to support greater OFF period on the L3_MAIN interconnect
 - All buffers associated to a single pipeline
 - Reallocation of the buffers of the nonactive pipelines to the active pipelines

13.2.2 DISPC Environment

The DISPC provides the required control signals to interface directly to an external parallel panel for the MIPI DPI protocol.

Figure 13-23 shows the LCD support parallel interface.

NOTE: Parallel interface is available through the LCD1, LCD2, LCD3, and TV outputs of the DISPC.

The LCD data and control signals are multiplexed with the TV output data, and control signals are provided by the HDMI module.

The selection can be done at the top level of the display subsystem. For further details and signal mapping, see Section 13.1.1, *Display Subsystem Environment*.

Figure 13-23. DISPC LCD Support Parallel Interface

dispc-083

NOTE: The path from a module pin to device pad (or pads) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see [Section 20.4.6.1.1](#), Pad Configuration Registers, in [Chapter 20 Control Module](#).

[Table 13-83](#) describes the interface signals to/from the LCD panel in bypass mode.

Table 13-83. DISPC Parallel Interface Signals

Signal Name ⁽¹⁾	Type ⁽²⁾	Description
voutX_d[23:0]	O	Pixel data
voutX_clk	O	Pixel clock
voutX_vsync	O	Vertical synchronization. The LCD frame clock (vsync) toggles after all the lines in a frame are transmitted to the LCD panel and a programmable number of line clock cycles has elapsed at the beginning and end of each frame.
voutX_hsync	O	Horizontal synchronization. The LCD line clock (hsync) toggles after all pixels in a line are transmitted to the LCD panel and a programmable number of pixel clock wait-states has elapsed at the beginning and end of each line.
voutX_de	O	In active matrix technology, the DE signal acts as an output-enable signal to indicate when data must be latched using the pixel clock.
voutX_fid	O	The FID signal indicates the field identifier for the LCD output field: <ul style="list-style-type: none"> • 0 means even. • 1 means odd.

⁽¹⁾ X = 1, 2, or 3, indicates the corresponding parallel video output (VOUT1, VOUT2, or VOUT3)

⁽²⁾ I = Input, O = Output, I/O = Input/Output

13.2.2.1 DISPC LCD Output and Data Format for the Parallel Interface

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

[Figure 13-24](#) through [Figure 13-27](#) show the pixel data bus, depending on the use of 12-, 16-, 18-, or 24-pixel data output pins.

In the Active matrix display type, one pixel per pixel clock is displayed.

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel.

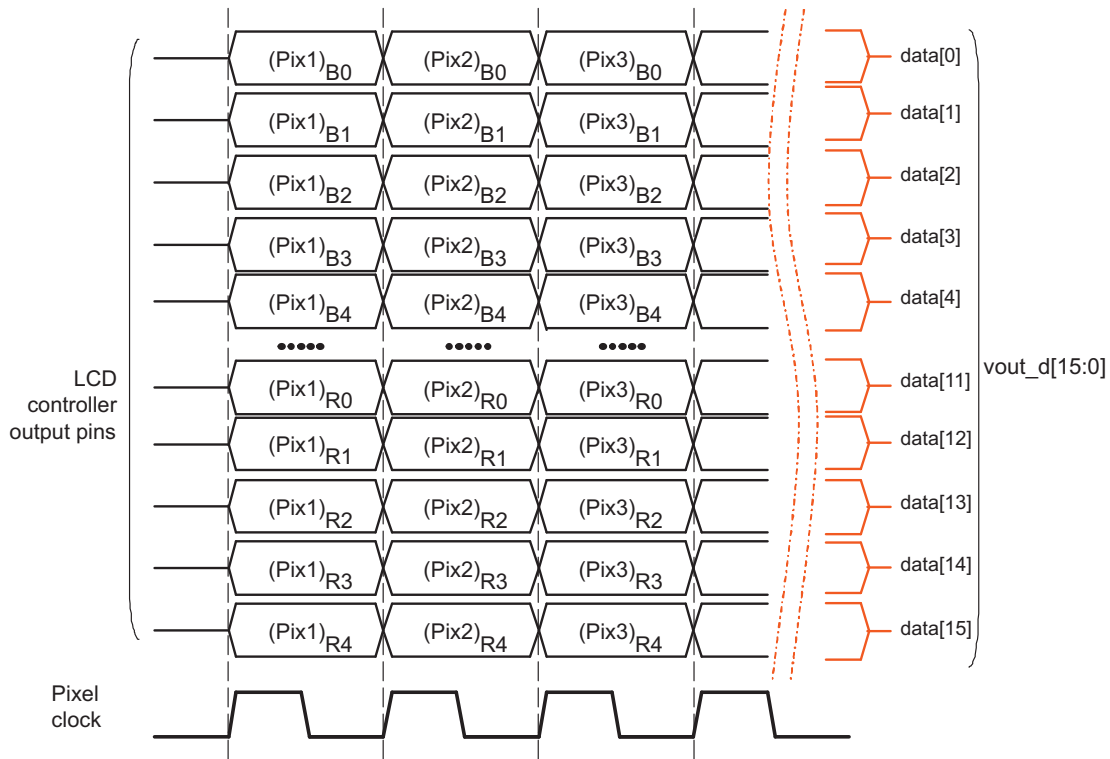

[Figure 13-24](#) through [Figure 13-27](#) show 12-, 16-, 18-, and 24-bit active matrix displays, respectively.

VFP	DISPC_TIMING_Vo[19:8] VFP value	Vertical front porch
VSW	DISPC_TIMING_Vo[7:0] VSW value + 1	Vertical synchronization pulse width
ONOFF ⁽¹⁾	DISPC_POL_FREQo[17] ONOFF	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF ⁽²⁾	DISPC_POL_FREQo[16] RF	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_POL_FREQo[15] IEO	Invert DISPC_ACBIAS
IPC ⁽³⁾	DISPC_POL_FREQo[14] IPC	Invert DISPC_PCLK
IHS	DISPC_POL_FREQo[13] IHS	Invert DISPC_HSYNC
IVS	DISPC_POL_FREQo[12] IVS	Invert DISPC_VSYNC

⁽¹⁾ DISPC_POL_FREQo[17] ONOFF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF must match (x = 0,1,2).

⁽²⁾ DISPC_POL_FREQo[16] RF and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_RF must match (x = 0,1,2).

⁽³⁾ DISPC_POL_FREQo[14] IPC and Control Module register CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC must match (x = 0,1,2).

- Active matrix timing configuration 1:
 - DISPC_POL_FREQo[17] ONOFF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_ON_OFF = 0
 - DISPC_POL_FREQo[16] RF = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_RF = 0
The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
 - DISPC_POL_FREQo[15] IEO = 0
The DE signal is active high.
 - DISPC_POL_FREQo[14] IPC = 0 and CTRL_CORE_SMA_SW_1[] DSS_CHx_IPC = 0
The pixel data are driven on the rising edge of PCLK.
 - DISPC_POL_FREQo[13] IHS = 0
The HSYNC signal is active high.
 - DISPC_POL_FREQo[12] IVS = 0
The VSYNC signal is active high.

Figure 13-28. DISPC Active Matrix Timing Diagram of Configuration 1 (Start of Frame)

Figure 13-29. DISPC Active Matrix Timing Diagram of Configuration 1 (Between Lines)

Figure 13-30. DISPC Active Matrix Timing Diagram of Configuration 1 (Between Frames)

Figure 13-31. DISPC Active Matrix Timing Diagram of Configuration 1 (End of Frame)

- Active matrix timing configuration 2:
 - DISPC_POL_FREQo[17] ONOFF = 1 and CTRL_CORE_SMA_SW_1[DSS_CHx_ON_OFF] = 1
 - DISPC_POL_FREQo[16] RF = 1 and CTRL_CORE_SMA_SW_1[DSS_CHx_RF] = 1
The HSYNC and VSYNC signals are driven on the rising edge of PCLK.
 - DISPC_POL_FREQo[15] IEO = 1
The DE signal is active low.
 - DISPC_POL_FREQo[14] IPC = 1 and CTRL_CORE_SMA_SW_1[DSS_CHx_IPC] = 1
The pixel data is driven on the falling edge of PCLK.
 - DISPC_POL_FREQo[13] IHS = 1
The HSYNC signal is active low.
 - DISPC_POL_FREQo[12] IVS = 1

The VSYNC signal is active low.

Figure 13-32. DISPC Active Matrix Timing Diagram of Configuration 2 (Start of Frame)

Figure 13-33. DISPC Active Matrix Timing Diagram of Configuration 2 (Between Lines)

Figure 13-34. DISPC Active Matrix Timing Diagram of Configuration 2 (Between Frames)

13.2.2.3 DISPC TV Output and Data Format for the Parallel Interface

This section describes the TV output pixel data bus for the parallel interface.

The TV pixel data interface is a 30-bit RGB interface. Only the MSB part of each color component is connected to the display subsystem boundary: R[9:2], G[9:2], B[9:2]. The output of the data is synchronized to the data request signal (HDMI_M_DE) from the HDMI encoder.

Figure 13-40 shows the format of the TV output pixel data.

Figure 13-40. DISPC TV Output Pixel Data

dispc-093

13.2.3 DISPC Integration

This section describes the DISPC integration in the device (see Figure 13-41). For complete details about clocks and resets, see Section 13.1, *Display Subsystem Overview*.

Figure 13-41. DISPC Integration

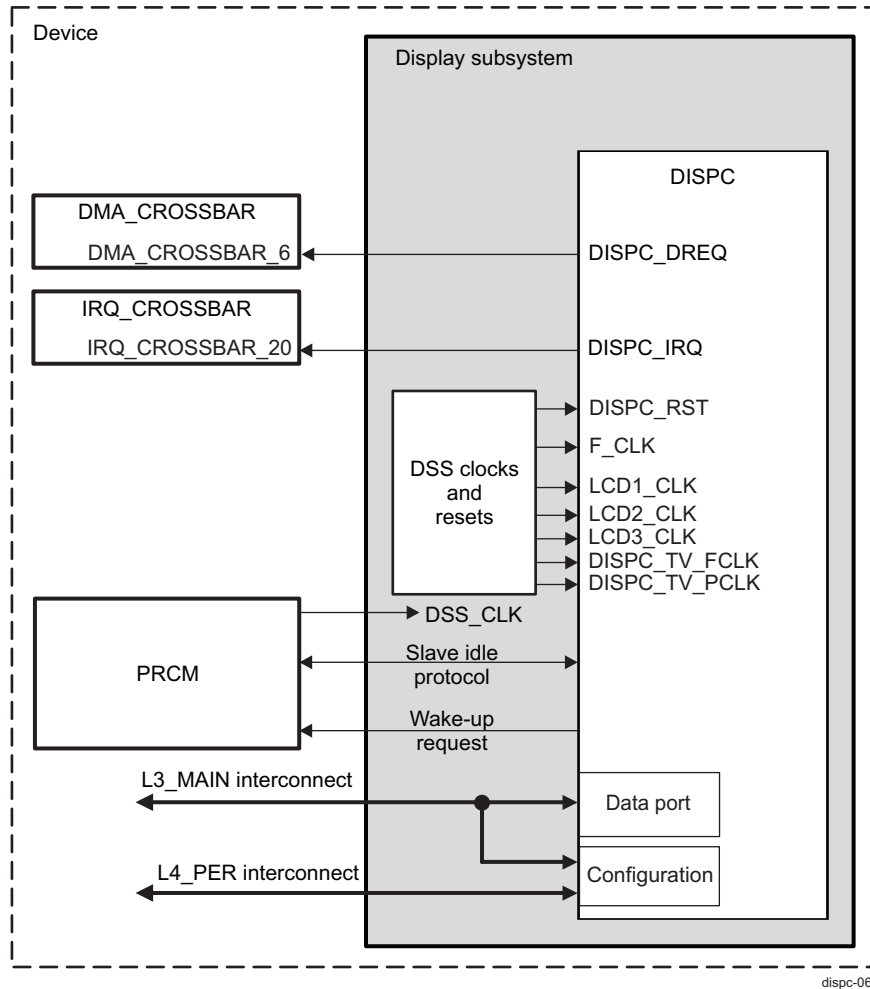

Table 13-86 and Table 13-87 list the integration attributes and clock and resets, respectively.

Table 13-86. DISPC Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DISPC	PD_DSS	L3_MAIN for data transfer and configuration

Table 13-87. DISPC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	F_CLK	DSS_CLK DPLL_DSI1_A_CLK1 DPLL_DSI1_B_CLK1 DPLL_DSI1_C_CLK1 DPLL_HDMI_CLK1	PRCM DPLL_VIDEO1 DPLL_VIDEO2 DPLL_HDMI External clocks	Functional clock for the DISPC logic. For the multiplexing description, see Section 13.1.2.1, Display Subsystem Clocks .
	LCD1_CLK	DSS_CLK DPLL_DSI1_A_CLK1	DPLL_VIDEO1 DPLL_HDMI External clocks	Clock used to generate the divided pixel clock for the primary LCD interface. For the multiplexing description, see Section 13.1.2.1, Display Subsystem Clocks .
	LCD2_CLK	DSS_CLK DPLL_DSI1_B_CLK1	PRCM DPLL_VIDEO1 DPLL_VIDEO2 DPLL_HDMI External clocks	Clock used to generate the divided pixel clock for the secondary LCD interface. For the multiplexing description, see Section 13.1.2.1, Display Subsystem Clocks .
	LCD3_CLK	DSS_CLK DPLL_DSI1_C_CLK1	DPLL_VIDEO1 DPLL_VIDEO2 DPLL_HDMI External clocks	Clock used to generate the divided pixel clock for the third LCD interface. For the multiplexing description, see Section 13.1.2.1, Display Subsystem Clocks .
	DISPC_TV_FCLK	F_CLK DPLL_HDMI_CLK1	DSS DPLL_HDMI	TV functional clock (this is either the F_CLK or a clock driven from the DPLL_HDMI). For the multiplexing description, see Section 13.1.2.1, Display Subsystem Clocks .
	DISPC_TV_CLK	DSS_HDMI_PCLK	HDMI	Pixel clock provided by the HDMI module. For the multiplexing description, see Section 13.1.2.1, Display Subsystem Clocks .
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DISPC	DISPC_RST	DSS_RST	PRCM	Hardware reset is coming from the PRCM module or through a software reset performed at the DSS level. For the tree reset description, see Section 13.1.2, Display Subsystem Integration . NOTE: The DSS_RST signal is provided to the entire display subsystem. When inside the display subsystem boundaries, it is named DISPSS_RST, which on its end is provided to the DISPC and is named DISPC_RST.

Table 13-88. DISPC Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	MPU_IRQ_25 DSP1_IRQ_58 DSP2_IRQ_58 IPU1_IRQ_26 IPU2_IRQ_26	DISPC interrupt requests.
DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	The line trigger signal to synchronize a memory-to-memory logical channel in the device DMA is generated by the DISPC IP.

Table 13-88. DISPC Hardware Requests (continued)

DMA_SYSTEM_DREQ_5

NOTE: The “**Default Mapping**” column in [Table 13-88 DISPC Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.

For more information about the IRQ_CROSSBAR module, see [Section 20.4.6.4, IRQ_CROSSBAR Module Functional Description](#), in [Chapter 20, Control Module](#).

For more information about the DMA_CROSSBAR module, see [Section 20.4.6.5, DMA_CROSSBAR Module Functional Description](#), in [Chapter 20, Control Module](#).

For more information about the device interrupt controllers, see [Chapter 19, Interrupt Controllers](#).

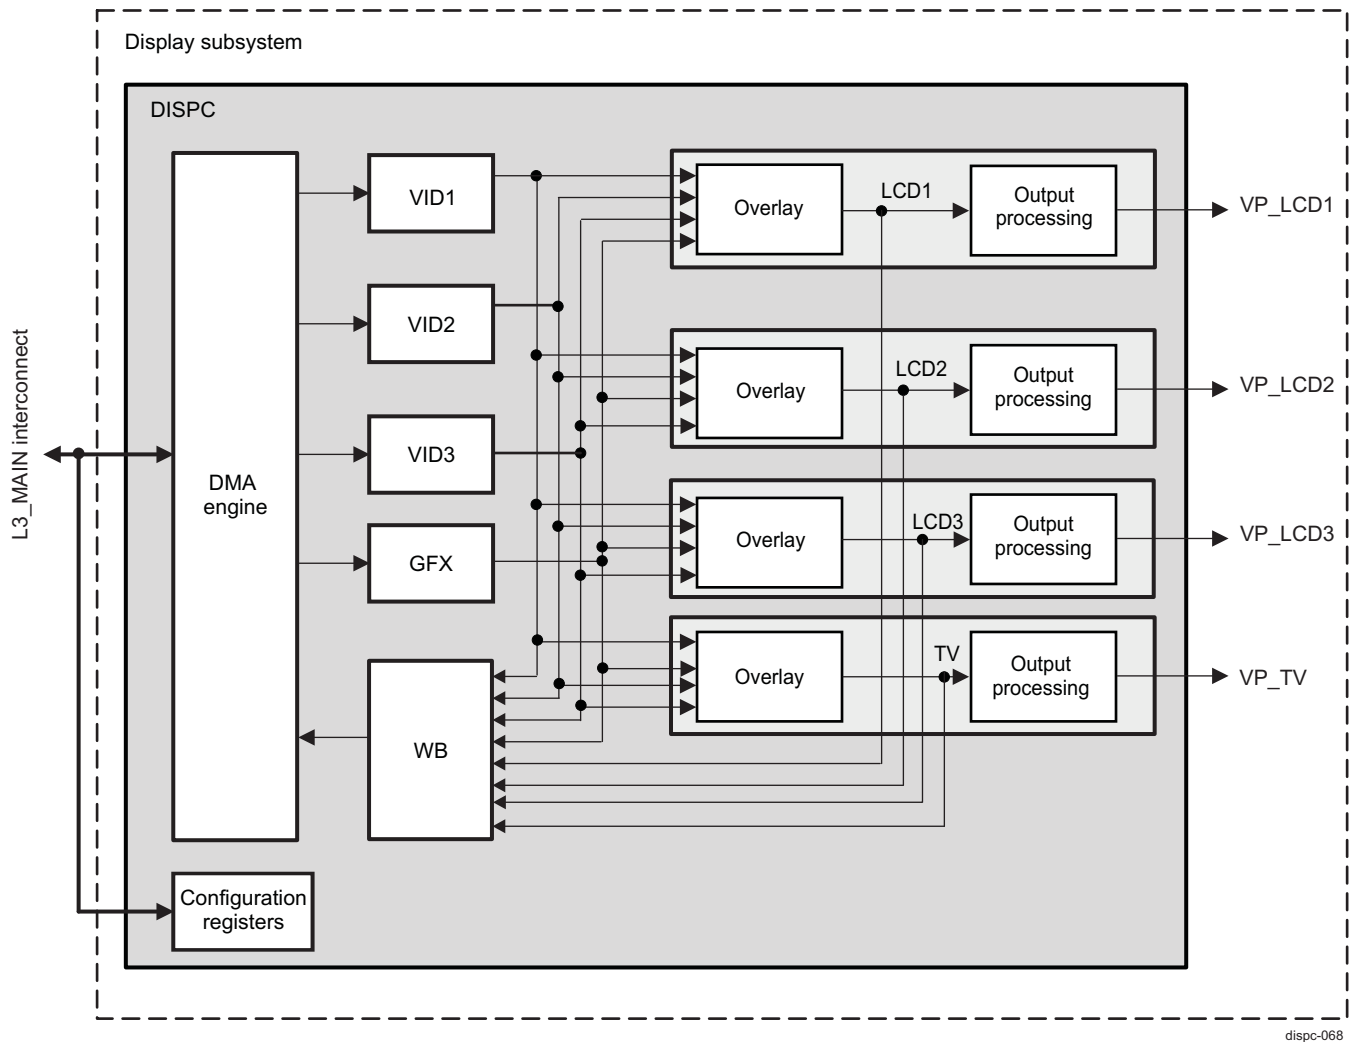

For more information about the device DMA_SYSTEM module, see [Section 18.1, System DMA](#).

For more information about the device EDMA module, see [Section 18.2, Enhanced DMA](#).

13.2.4 DISPC Functional Description

The DISPC can read and display the encoded pixel data stored in memory (see Figure 13-42).

Figure 13-42. DISPC Architecture Overview

dispc-068

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (replication, antiflicker) and video pipelines (VC-1, color space conversion, scaling, overlay, transparency, and so forth).

The data coming out of a pipeline is sent to one of the four outputs, depending on the user configuration. An overlay manager manages inputs of multiple pipelines. User timing configurations for LCD and TV are available.

The DISPC allows the capturing of one output of the pipeline or overlay manager to redirect it into the WB pipeline. It allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing, and so forth to perform memory-to-memory transfer with data processing.

13.2.4.1 DISPC Clock Configuration

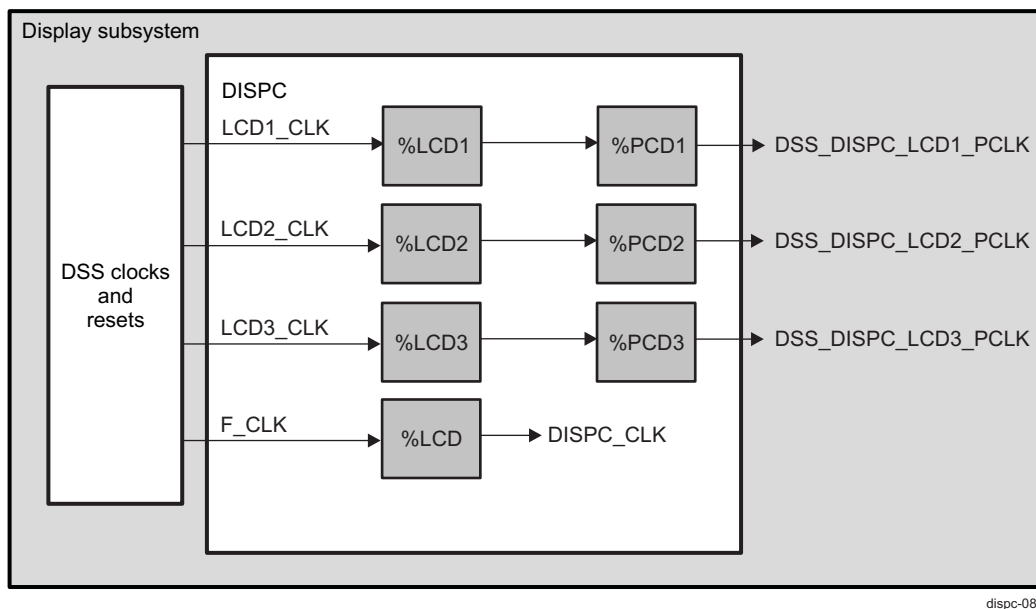

The PCLK frequency for each LCD output is derived from a dedicated input clock: LCD1_CLK, LCD2_CLK, or LCD3_CLK for the three LCD outputs, respectively. Each input clock is divided by the values of the DISPC_DIVISORo[23:16] LCD bit field and then the DISPC_DIVISORo[7:0] PCD bit field independently for each LCD pixel clock (see [Figure 13-43](#)). DSS_DISPC_LCD1_PCLK, DSS_DISPC_LCD2_PCLK, and DSS_DISPC_LCD3_PCLK are independent:

- $DSS_DISPC_LCD1_PCLK = (LCD1_CLK / LCD1) / PCD1$
- $DSS_DISPC_LCD2_PCLK = (LCD2_CLK / LCD2) / PCD2$
- $DSS_DISPC_LCD3_PCLK = (LCD3_CLK / LCD3) / PCD3$

The functional clock of the DISPC is derived from F_CLK by an independent divisor. The dividing value is set in the DISPC_DIVISORo[23:16] LCD bit field.

For backward compatibility, the divisor value LCD can be set to the value of LCD1. To enable this functionality, the [DISPC_DIVISOR\[0\] ENABLE](#) bit must be set to 1.

Figure 13-43. DISPC Clock Tree Overview

13.2.4.2 DISPC Software Reset

To perform a software reset on the DISPC, set the [DISPC_SYSCONFIG\[1\] SOFTRESET](#) bit to 0x1. The [DISPC_SYSSTATUS\[0\] RESETDONE](#) bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the [DISPC_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset. Software must ensure that the software reset completes before performing DISPC operations.

13.2.4.3 DISPC Power Management

The DISPC supports the MStandby/Wait, IdleReq/SIdleAck, and wake-up protocols as defined in [Chapter 3, Power, Reset, and Clock Management](#).

13.2.4.3.1 DISPC Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG\[4:3\] SIDLEMODE](#) bit field.

Condition of assertion of the SIdleAck signal:

- In no-idle mode: SIdleAck is never asserted.
- In force-idle mode: SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle

delay with respect to an IdleReq assertion.

NOTE: The proper use of force-idle mode assumes that no interrupt needs to be generated.

- In smart-idle mode: SIdleAck is asserted when at least the following conditions are satisfied:
 - No interrupt is pending.
 - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted, the DISPC interface lock used by the slave port can be shut down at any time.

The conditions of deassertion of the SIdleAck signal are:

- In force-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.
- In smart-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

13.2.4.3.2 DISPC StandBy Mode

The DISPC supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the [DISPC_SYSCONFIG\[13:12\] MIDDLEMODE](#) bit field. The functional clock is always active if the module is enabled. The L3_MAIN clock can be shut down at any time independently of the status of MStandby.

The conditions of assertion of the MStandby signal are:

- In no-standby mode: MStandby is never asserted.
- In force-standby mode: MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
 - The GFX pipeline is disabled or enabled and the data fetch is complete for the GFX window, or the GFX pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The VID1 pipeline is disabled or enabled and the data fetch is complete for the VID1 window, or the VID1 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The VID2 pipeline is disabled or enabled and the data fetch is complete for the VID2 window, or the VID2 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The VID3 pipeline is disabled or enabled and the data fetch is complete for the VID3 window, or the VID3 pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
 - The WB pipeline is disabled or enabled and the data store to memory is complete for the WB picture, or the WB pipeline is enabled but the data storage did not complete and data in the DMA buffer is lower than the low threshold value.

The MStandby signal asserts whenever all five events have occurred or the DISPC is disabled. While MStandby is asserted, the DISPC does not generate any transaction on the L3_MAIN master port.

The conditions of deassertion of the MStandby signal are:

- In force-standby mode: MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
 - The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
 - The VID1 pipeline is enabled but the data fetch did not complete for the VID1 window, and the data in the DMA buffer is less than the low threshold value.
 - The VID2 pipeline is enabled but the data fetch did not complete for the VID2 window, and the data in the DMA buffer is less than the low threshold value.

- The VID3 pipeline is enabled but the data fetch did not complete for the VID3 window, and the data in the DMA buffer is less than the low threshold value.
- The WB pipeline is enabled but the data store did not complete for the WB picture, and the data in the DMA buffer more than the high threshold value.

Detection of the deassertion conditions assumes that the interface clocks are active.

13.2.4.3.3 DISPC Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG\[2\]](#) ENAWAKEUP bit. Because the SWakeup signal is asynchronous, it does not require the interface clock.

The conditions of assertion of the SWakeup signal are:

- The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
- The VID1 pipeline is enabled but the data fetch did not complete for the VID1 window, and the data in the DMA buffer is less than the low threshold value.
- The VID2 pipeline is enabled but the data fetch did not complete for the VID2 window, and the data in the DMA buffer is less than the low threshold value.
- The VID3 pipeline is enabled but the data fetch did not complete for the VID3 window, and the data in the DMA buffer is less than the low threshold value.
- The WB pipeline is enabled and the data in the DMA buffer is more than the high threshold value.
- The last pixel displayed into the LCD1 panel if it is not the last frame
- The last pixel displayed into the LCD2 panel if it is not the last frame
- The last pixel displayed into the LCD3 panel if it is not the last frame
- The last pixel displayed into the TV panel if it is not the last frame

The SWakeup signal is asserted whenever any one of these nine events occurs and IdleAck is asserted.

When one of the active pipelines reaches the low threshold and must refill its DMA buffer for the current frame, all other pipelines refill their own DMA buffer even if their low threshold has not been reached. The [DISPC_CONFIG1\[17\]](#) BUFFERFILLING bit is used to increase the probability that the time increases, where there is no access to the L3_MAIN interconnect.

The condition of deassertion of the SWakeup signal is:

- Immediately after deassertion of IdleReq

13.2.4.4 DISPC Interrupt Requests

The interrupt line, DISPC_DREQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the [DISPC_IRQENABLE](#) register.

To check when a particular interrupt event occurs and to reset a particular event, the [DISPC_IRQSTATUS](#) register must be accessed. This register regroups the status of internal events in the module that generate an interrupt (read 0: no interrupt occurred; read 1: interrupt occurred; write 1: status bit reset). For more information about checking and clearing interrupt events, see [Section 13.1.5, Display Subsystem Register Manual](#).

[Table 13-89](#) describes the interrupts generated for the DISPC.

Table 13-89. DISPC Interrupts

Interrupt Name	Description
FLIPIMMEDIATEDONE_IRQ	Flip immediate done: Occurs when the DMA engine has acknowledged the immediate BA change, and software can write the new BA0.
FRAMEDONE1_IRQ	Frame done for LCD1 output: Active frame related to the LCD1 is complete and LCD1 output of the DISPC is disabled.

Table 13-89. DISPC Interrupts (continued)

Interrupt Name	Description
FRAMEDONE2_IRQ	Framedone for LCD2 output: Active frame related to the LCD2 is complete and LCD2 output of the DISPC is disabled.
FRAMEDONE3_IRQ	Frame done for LCD3 output: Active frame related to the LCD3 is complete and LCD3 output of the DISPC is disabled.
FRAMEDONETV_IRQ	Frame done for TV output: Active frame related to the TV output is complete and TV output of the DISPC is disabled.
FRAMEDONEWB_IRQ	Frame done for WB output: Active frame related to the WB is complete. First, it is used when the WB channel is connected to one of the pipelines to determine when the memory-to-memory transfer through DISPC is completed. Second, it is used when the WB channel is connected to one of the overlay output in nonreal-time mode to determine when the memory-to-memory transfer with overlay processing is completed.
VSYNC1_IRQ	VSYNC for primary LCD output: VSYNC interrupt for the primary LCD has occurred at the end of the frame.
VSYNC2_IRQ	VSYNC for secondary LCD output: VSYNC interrupt for the secondary LCD has occurred at the end of the frame.
VSYNC3_IRQ	VSYNC for third LCD output: VSYNC interrupt for the third LCD has occurred at the end of the frame.
EVSYNC_EVEN_IRQ	VSYNC for even field: EVSYNC_EVEN interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is even) (HDMI)
EVSYNC_ODD_IRQ	VSYNC for odd field: EVSYNC_ODD interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is odd) (HDMI)
ACBIASCOUNTSTATUS1_IRQ	AC bias count status for LCD1 output: AC bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS2_IRQ	AC bias count status for LCD2 output: AC bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS3_IRQ	AC bias count status for LCD3 output: AC bias transition counter has decremented to 0.
PROGRAMMEDLINENUMBER_IRQ	Programmed line number: The primary LCD has reached the user programmed line number.
VID1ENDWINDOW_IRQ	End of the VID1 window: The DMA engine has fetched all the data from memory for the VID1 for the current frame.
VID2ENDWINDOW_IRQ	End of the VID2 window: The DMA engine has fetched all the data from memory for the VID2 for the current frame.
VID3ENDWINDOW_IRQ	End of the VID3 window: The DMA engine has fetched all the data from memory for the VID3 for the current frame.
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.
VID1BUFFERUNDERFLOW_IRQ	VID1 DMA buffer underflow: The input VID1 DMA buffer goes underflow.
VID2BUFFERUNDERFLOW_IRQ	VID2 DMA buffer underflow: The input VID2 DMA buffer goes underflow.
VID3BUFFERUNDERFLOW_IRQ	VID3 DMA buffer underflow: The input VID3 DMA buffer goes underflow.
WBBUFFEROVERFLOW_IRQ	WB DMA buffer overflow: The output WB DMA buffer goes overflow. It cannot occur when WB channel is used in memory-to-memory transfer mode but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory-to-memory mode, there is timing constraint.
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input graphics DMA buffer goes underflow.
PALETTEGAMMALOADING_IRQ	Gamma table loading: Gamma table in the graphics pipeline has been loaded using the DISPC DMA engine.

Table 13-89. DISPC Interrupts (continued)

Interrupt Name	Description
WBUNCOMPLETEERROR_IRQ	The write-back buffer has been flushed before being fully drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that, and will trigger every frame.
OCPERROR_IRQ	OCP error: L3_MAIN interconnect has sent SResp = ERR
SYNCLOST1_IRQ	Synchronization lost on LCD1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOST2_IRQ	Synchronization lost on LCD2 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOST3_IRQ	Synchronization lost on LCD3 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLOSTTV_IRQ	Synchronization lost on TV output: Occurs when porches are not wide enough to load the pipelines with data (TV output connected to the HDMI).
WAKEUP_IRQ	Wakeup: Occurs when the SWakeUp signal is asserted.

13.2.4.5 DISPC DMA Requests

The DMA synchronization line, DISPC_DREQ, is connected to the device DMA controllers (see [Table 13-88, DMA Requests](#)). This DMA request is not a classical one, but rather a synchronization signal between the DISPC and device DMA. The device DMA is informed that a programmable number of lines are output to the LCD and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in [Table 13-89](#). This allows the device DMA channel to be synchronized with the internal DMA controller in the display subsystem.

In other words, it allows synchronizing a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DISPC_DREQ request is generated at a programmable line number defined in the [DISPC_LINE_NUMBER\[11:0\] LINENUMBER](#) bit field. This process allows an application to use a single frame buffer and to update it after a certain number of lines are read by the DISPC.

13.2.4.6 DISPC DMA Engine

The DMA engine:

- Supplies data (encoded pixel data and gamma curve) from memories to the GFX, VID1, VID2, and VID3 pipelines through the interconnect based on the configuration of the DISPC and pipeline setting.
- Stores encoded pixel data from GFX/VID pipelines or overlays to memories through the WB pipeline and interconnect based on the configuration of the DISPC and WB pipeline setting.

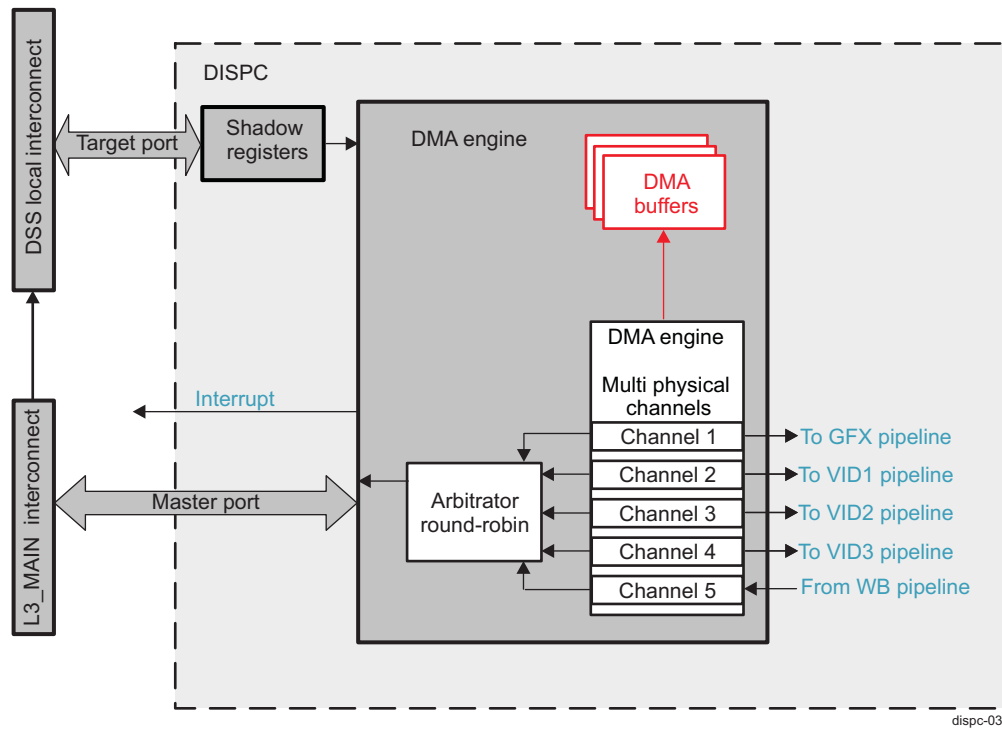

Each pipeline has a dedicated buffer and a channel with independent settings. [Table 13-90](#) lists the default size and allocation of the DMA buffer. Each DMA buffer is divided into two spaces, top and bottom. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each pipeline is from 0 (pipeline inactive) to the number of pipelines \times 2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of available spaces. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and system latency. The space assignments are done in the [DISPC_GLOBAL_BUFFER](#) register.

Table 13-90. DISPC DMA Buffer Size

Pipelines	DMA Buffer Size
GFX	2 lines × 640 × 128 bits
VID1	2 lines × 1024 × 128 bits
VID2	2 lines × 1024 × 128 bits
VID3	2 lines × 1024 × 128 bits
WB	2 lines × 1024 × 128 bits

Figure 13-44 is an overview of the DMA engine.

Figure 13-44. DISPC DMA Engine Overview

13.2.4.6.1 DISPC Addressing and Bursts

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address
- Aligns the address
- Defines the burst structure:
 - Type of burst (1D- or 2D-burst structure)
 - Length of the burst

The DMA engine generates scan addresses to read and write data to and from system memory. The base address defines the start address of the first pixel, and then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The byte address of each pixel in the frame buffer in the system memory is determined by:

$$\text{Pixel address} = \text{Base address} + x \times \text{bpp} + (y \times ((\text{width} \times \text{bpp}) + \text{increment}))$$

where:

- Base address corresponds to the base address (for YUV–NV12 or YUV4:2:0–NV21 format) defined by:
 - DISPC_GFX_BA_0[31:0] BA bit field
 - DISPC_GFX_BA_1[31:0] BA bit field

- DISPC_VIDp_BA_0[31:0] BA bit field
- DISPC_VIDp_BA_1[31:0] BA bit field
- DISPC_VIDp_BA_UV_0[31:0] BA bit field
- DISPC_VIDp_BA_UV_1[31:0] BA bit field
- bpp corresponds to the number of bits per pixel defined by the [DISPC_GFX_ATTRIBUTES\[4:1\] FORMAT](#) bit field or the [DISPC_VIDp_ATTRIBUTES\[4:1\] FORMAT](#) bit field.
- width corresponds to the number of pixels per line defined by the [DISPC_GFX_SIZE\[10:0\] SIZEX + 1](#) bit field or [DISPC_VIDp_SIZE\[10:0\] SIZEX + 1](#) bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by the [DISPC_GFX_ROW_INC\[31:0\] ROWINC – 1](#) bit field or the [DISPC_VIDp_ROW_INC\[31:0\] ROWINC – 1](#) bit field.
- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

NOTE: For YUV format, the pixel values are defined in two buffers (Y and UV). The base address of the Y buffers is defined in the [DISPC_VIDp_BA_j\[31:0\] BA](#) bit field. The base address of the UV buffers is defined in the [DISPC_VIDp_BA_UV_j\[31:0\] BA](#) bit field.

Table 13-91 summarizes the register settings for a simple access of a picture in the system memory.

Table 13-91. DISPC Register Settings for Accessing Image in Internal Memory

Registers	Value
DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j	PBA, the physical base address of image in the memory
DISPC_VIDp_BA_UV_j/DISPC_WB_BA_UV_j	PBA, the physical base address of UV buffers image in the memory
DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC	1 or other in pixel incremental value
DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC	1 or other in row incremental value

An interconnect request (128 bits) corresponds to one or several pixels, depending on the bits per pixel. Therefore, the DMA engine determines the appropriate burst sequence to optimize the fetching/storing of each new line. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports bursts of 2×128 bits, 4×128 bits, and 8×128 bits. The default burst size at reset time is 8×128 bits. The maximum burst size can be configured for each pipeline by setting the [DISPC_GFX_ATTRIBUTES\[7:6\] BURSTSIZE](#) or [DISPC_VIDp_ATTRIBUTES\[15:14\] BURSTSIZE](#) bit field. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue one request and/or smaller burst requests. Two types of burst are present which can be configured from the [DISPC_GFX_ATTRIBUTES\[29\] BURSTTYPE](#) or [DISPC_VIDp_ATTRIBUTES\[29\] BURSTTYPE](#) bit. Also, a force function is present configured from the [DISPC_GFX_ATTRIBUTES\[16\] FORCE1DTILEDMODE](#) or [DISPC_VIDp_ATTRIBUTES\[20\] FORCE1DTILEDMODE](#) or [DISPC_WB_ATTRIBUTES\[20\] FORCE1DTILEDMODE](#) bit for the following burst types:

- 1-D burst is used if the fetch/storage is linear in memory through the TILER. There is no rotation of the frame buffer. The frame buffer is not tiled.
- 2-D burst is used if the frame buffer is tiled.

Even if the [DISPC_VIDp_ROW_INC](#) register does not equal 1, the user can select 2-D burst. 2-D burst is used when the DISPC is configured to read one field of a frame by accessing only the even and odd lines.

NOTE: The burst size is initialized once at configuration and can be changed when the DISPC is disabled.

13.2.4.6.2 DISPC Immediate Base Address Flip Mechanism

The Flip Immediate mechanism is used to change of the fly the content of the frame buffer which is currently being displayed. The mechanism allows multiple changes (flips) of the base address (BA) during a frame. The mechanism is available for all pipelines (VID1, VID2, VID3, and GFX). Changes to the BA can be applied during the same line, or during different lines.

The following considerations must be considered:

- Data fetching from a new immediate BA is aligned with the data fetch mechanism of the DISPC DMA engine itself, and not with HSYNC or any other DISPC timing signal. After new VSYNC frame pulse, new BA is taken by hardware, as soon as the first set of lines is sent to internal pipeline of the DMA engine.
 - If multiple new BAs are written during the same line (before DMA engine acknowledges the first BA change), then programming steps 1 and 2 must be applied for each new BA (see the programming sequence in this section). The DMA takes only the last BA provided within the current line scan.
 - If multiple new BAs are written during different lines within the current frame, then programming steps 1 and 2 must be applied for each new BA (see the programming sequence in this section). The DMA takes the new BA each time it is updated.
- Immediate BA change cannot be achieved synchronously for two or more pipelines.
- Immediate BA change is possible only for BA0; it is not possible for BA1. Interlaced mode using BA0 and BA1 is not supported.
- Immediate BA change is supported only in RGB color space.

The Flip Immediate mechanism programming sequence follows:

1. Software writes the new immediate BA to the [DISPC_GFX_BA_j](#) register (where j=0) for the GFX pipeline, or to the [DISPC_VID1_BA_j](#) / [DISPC_VID2_BA_j](#) / [DISPC_VID3_BA_j](#) register (where j=0) for the required VID pipeline.
2. Software sets to 0x1 the corresponding EN bit for the required pipeline in the [DISPC_BA0_FLIPIMMEDIATE_EN](#) register.
3. The DISPC DMA engine, after completing its current line (or set of lines) fetch, takes the new immediate BA.
4. Hardware resets the EN bit in [DISPC_BA0_FLIPIMMEDIATE_EN](#) register and asserts a flip immediate IRQ. The IRQ can be enabled through the [DISPC_IRQENABLE\[31\]](#) FLIPIMMEDIATEDONE_EN bit. The status of the event is available in the [DISPC_IRQSTATUS\[31\]](#) FLIPIMMEDIATEDONE_IRQ bit.

13.2.4.6.3 DISPC DMA Buffers

13.2.4.6.3.1 DISPC READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line or the external VSYNC is received, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3_MAIN interconnect. Enabling or disabling the DISPC flushes the DMA buffers (except the WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3_MAIN interconnect.

- When low threshold (set in the [DISPC_GFX_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD or [DISPC_VIDp_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3_MAIN interconnect to fill the DMA buffer.
- When high threshold (set in the [DISPC_GFX_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD or [DISPC_VIDp_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.
