## description

The SN74ALB16244 16-bit buffer and line driver is designed for high-speed, low-voltage (3.3-V) V<sub>CC</sub> operation. This device is intended to replace the conventional driver in any speed-critical path. The small propagation delay is achieved using a unity-gain amplifier on the input and feedback resistors from input to output, which allows the output to track the input with a small offset voltage.

The device can be used as four 4-bit buffers, two 8-bit buffers, or one 16-bit buffer. This device provides true outputs and symmetrical active-low output-enable ( $\overline{OE}$ ) inputs.
