 Please contact us about dynamic load and input response.
 This is the value that measured on measuring board with capacitor of 22 µF *5
 and 0.1 µF at 150mm from output terminal.

 Measured by 20MHz oscilloscope or Ripple-Noise meter (Equivalent to *7
 KEISOKU-GIRKN: RM103).
 Please refer to the instruction manual 2.5.
- Drift is the change in DC output for an eight hour period after a half-hour warm-up at 25°C, with the input voltage held constant at the rated input/output.
- Please contact us about another class.
- Case size contains neither the umbo.

 Only as standard mounting orientation (A). Refer to the instruction manual 4.1. If install other than standard mounting orientation (A), please fix the power supply for withstand the vibration and impact.
- Burst operation at 30% load or less. Please contact us about DC input voltage. To meet the specifications. Do not operate over-loaded condition.
