Functional Description

CY62157H is a high-performance CMOS low-power (MoBL) SRAM device with Embedded Error-Correcting Code. ECC logic can detect and correct single bit error in accessed location.

This device is offered in dual chip enable option. Dual chip enable devices are accessed by asserting both chip enable inputs – $\overline{CE_1}$ as LOW and CE_2 as HIGH.

Data writes are performed by asserting the Write Enable input ($\overline{WE}$ LOW), and providing the data and address on device data (I/O_0 through I/O_{15}) and address (A_0 through A_{18}) pins respectively. The Byte High/Low Enable ($\overline{BHE}$, $\overline{BLE}$) inputs control byte writes, and write data on the corresponding I/O lines to the memory location specified. $\overline{BHE}$ controls I/O_8 through I/O_{15} and $\overline{BLE}$ controls I/O_0 through I/O_7.

Data reads are performed by asserting the Output Enable ($\overline{OE}$) input and providing the required address on the address lines. Read data is accessible on I/O lines (I/O_0 through I/O_{15}). Byte accesses can be performed by asserting the required byte enable signal ($\overline{BHE}$, $\overline{BLE}$) to read either the upper byte or the lower byte of data from the specified address location.

All I/Os (I/O_0 through I/O_{15}) are placed in a high impedance state when the device is deselected ($\overline{CE_1}$ HIGH / CE_2 LOW for dual chip enable device), or control signals are de-asserted ($\overline{OE}$, $\overline{BLE}$, $\overline{BHE}$).

These devices also have a unique "Byte Power down" feature, where, if both the Byte Enables ($\overline{BHE}$ and $\overline{BLE}$) are disabled, the devices seamlessly switch to standby mode irrespective of the state of the chip enable(s), thereby saving power.

The CY62157H device is available in a Pb-free 48-ball VFBGA and 48-pin TSOP I packages. The logic block diagram is on page 2.

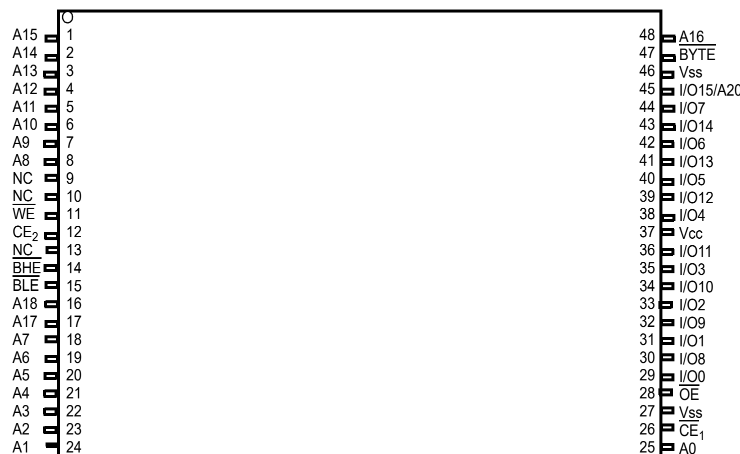
Figure 2. 48-pin TSOP I pinout (Dual Chip Enable) [2, 3]



Notes

2. NC pins are not connected internally to the die and are typically used for address expansion to a higher-density device. Refer to the respective datasheets for pin configuration.
3. Tie the BYTE pin in the 48-pin TSOP I package to V_{CC} to use the device as a 1 M × 16 SRAM. The 48-pin TSOP I package can also be used as a 2 M × 8 SRAM by tying the BYTE signal to V_{SS}. In the 2 M × 8 configuration, Pin 45 is the extra address line A20, while BHE, BLE, and I/O_8 to I/O_{14} pins are not used and can be left floating.

Notes

15. Test conditions assume signal transition time (rise/fall) of 3 ns or less, timing reference levels of 1.5 V (for $V_{CC} \geq 3$ V) and $V_{CC}/2$ (for $V_{CC} < 3$ V), and input pulse levels of 0 to 3 V (for $V_{CC} \geq 3$ V) and 0 to V_{CC} (for $V_{CC} < 3$V). Test conditions for the read cycle use output loading shown in AC Test Loads and Waveforms section, unless specified otherwise.
16. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZBE} is less than t_{LZBE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any device.
17. t_{HZOE}, t_{HZCE}, t_{HZBE}, and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
18. The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE}_1 = V_{IL}$, $\overline{BHE}$ or $\overline{BLE}$ or both $= V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
19. The minimum write cycle pulse width for Write Cycle No. 1 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) should be equal to the sum of t_{HZWE} and t_{SD}.

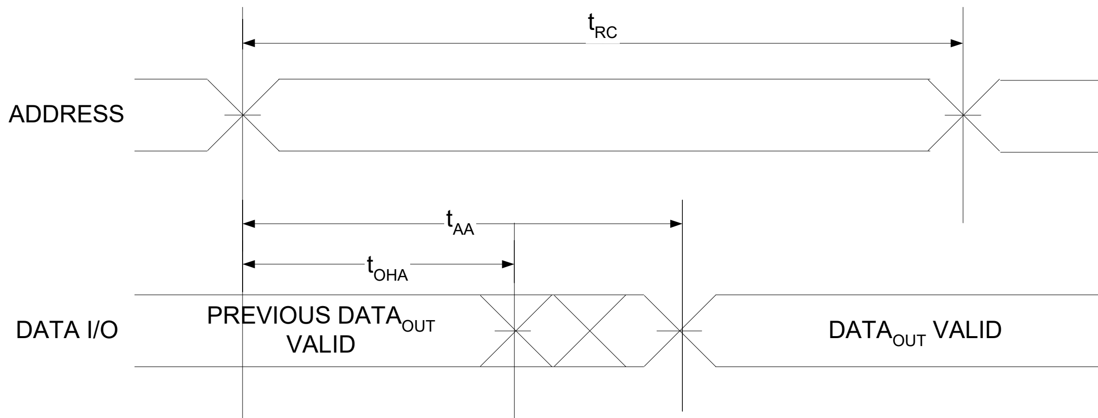

Figure 6. Read Cycle No. 2 ($\overline{OE}$ Controlled) [21, 22, 23]

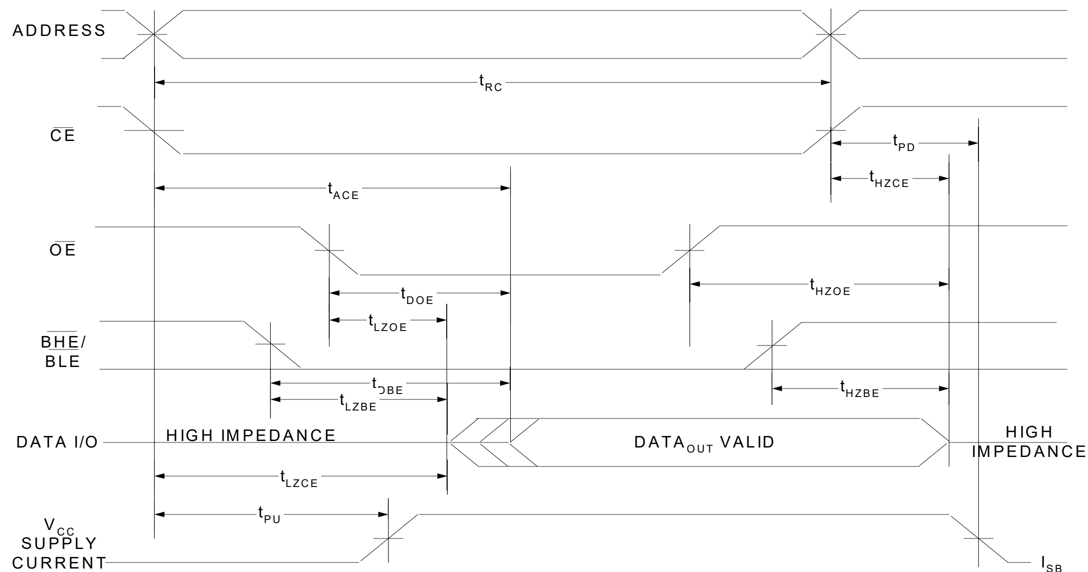

Notes

20. The device is continuously selected. $\overline{OE}$ = V_{IL}, $\overline{CE}$ = V_{IL}, $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IL}.
21. $\overline{WE}$ is HIGH for read cycle.
22. For all dual chip enable devices, $\overline{CE}$ is the logical combination of $\overline{CE}_1$ and CE_2. When $\overline{CE}_1$ is LOW and CE_2 is HIGH, $\overline{CE}$ is LOW; when $\overline{CE}_1$ is HIGH or CE_2 is LOW, $\overline{CE}$ is HIGH.
23. Address valid prior to or coincident with $\overline{CE}$ LOW transition.

Notes

24. For all dual chip enable devices, $\overline{CE}$ is the logical combination of $\overline{CE}_1$ and CE_2. When $\overline{CE}_1$ is LOW and CE_2 is HIGH, $\overline{CE}$ is LOW; when $\overline{CE}_1$ is HIGH or CE_2 is LOW, $\overline{CE}$ is HIGH.
25. The internal write time of the memory is defined by the overlap of $\overline{WE}$ = V_{IL}, $\overline{CE}_1$ = V_{IL}, $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IL}, and CE_2 = V_{IH}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
26. Data I/O is in high impedance state if $\overline{CE}$ = V_{IH}, or $\overline{OE}$ = V_{IH} or $\overline{BHE}$, and/or $\overline{BLE}$ = V_{IH}.
27. The minimum write cycle pulse width for Write Cycle No. 1 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) should be equal to the sum of t_{HZWE} and t_{SD}.
28. During this period the I/Os are in output state. Do not apply input signals.

Switching Waveforms (continued)

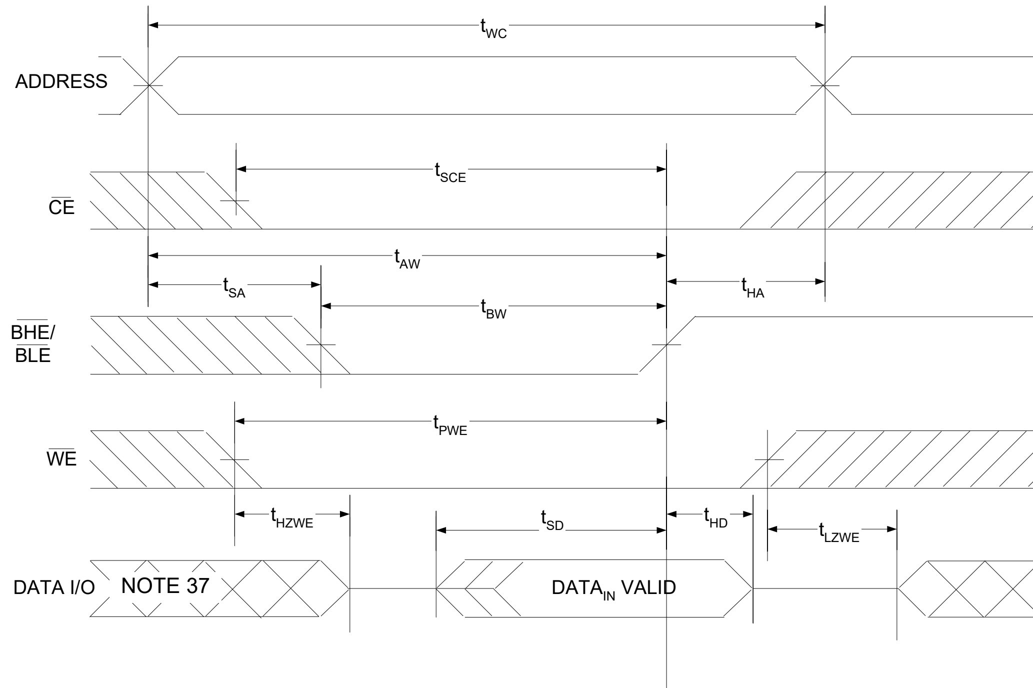
Notes

29. For all dual chip enable devices, $\overline{CE}$ is the logical combination of $\overline{CE}_1$ and CE_2. When $\overline{CE}_1$ is LOW and CE_2 is HIGH, $\overline{CE}$ is LOW; when $\overline{CE}_1$ is HIGH or CE_2 is LOW, $\overline{CE}$ is HIGH.
30. The internal write time of the memory is defined by the overlap of $\overline{WE} = V_{IL}$, $\overline{CE}_1 = V_{IL}$, $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IL}, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
31. Data I/O is in high impedance state if $\overline{CE} = V_{IH}$, or $\overline{OE} = V_{IH}$ or $\overline{BHE}$, and/or $\overline{BLE} = V_{IH}$.
32. During this period the I/Os are in output state. Do not apply input signals.

Switching Waveforms (continued)

Figure 9. Write Cycle No. 3 (BHE/BLE controlled, OE LOW) [33, 34, 35, 36]

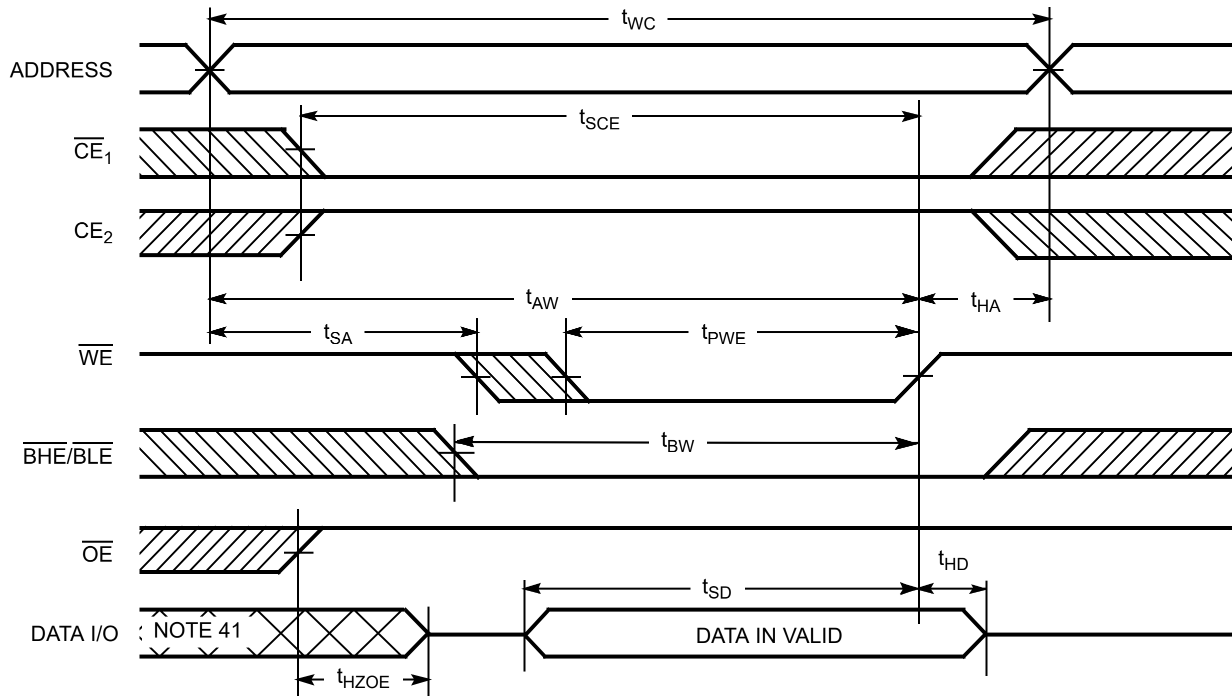


Notes

33. For all dual chip enable devices, CE is the logical combination of CE_1 and CE_2. When CE_1 is LOW and CE_2 is HIGH, CE is LOW; when CE_1 is HIGH or CE_2 is LOW, CE is HIGH.
34. The internal write time of the memory is defined by the overlap of WE = V_{IL}, CE_1 = V_{IL}, BHE or BLE or both = V_{IL}, and CE_2 = V_{IH}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
35. Data I/O is in high impedance state if CE = V_{IH}, or OE = V_{IH} or BHE, and/or BLE = V_{IH}.
36. The minimum write cycle pulse width for Write Cycle No. 3 (BHE/BLE Controlled, OE LOW) should be equal to the sum of t_{HZWE} and t_{SD}.
37. During this period the I/Os are in output state. Do not apply input signals.

Switching Waveforms (continued)

Figure 10. Write Cycle No. 4 ($\overline{WE}$ Controlled) [38, 39, 40]



Notes

38. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE}_1 = V_{IL}$, $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IL}, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.
39. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
40. If $\overline{CE}_1$ goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
41. During this period the I/Os are in output state. Do not apply input signals.
